16. The modulator is a magnet originally built as a prototype for the NSLS soft x-ray undulator at beam-line X1, and the radiator is the prototype for the APS undulator A, which was at one time installed and tested in CESR at Cornell University. Both of these magnets were re-measured and shimmed to provide the required field

- quality for the HGHG experiment. A new electromagnet was built to serve as the dispersion section.
