

Lasers and Plasmas

Wim Leemans

Lawrence Berkeley National Laboratory

P5 Meeting @ BNL

March 6-8, 2008

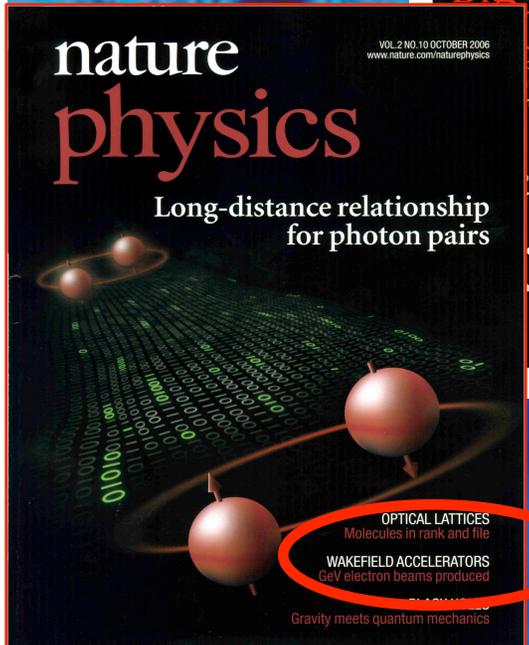

**Office of
Science**

Can lasers and plasmas play a role in future high energy accelerators?

14 TeV CM pp , LHC at CERN
-27 km, \$6 Billion+
RF: 10- 100 MV/m
Plasma: 10-100 GV/m
Smaller?
Cheaper?

Science & Technology

Particle physics The light fantastic

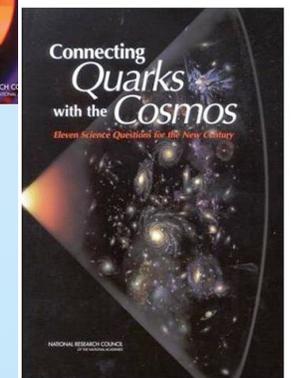

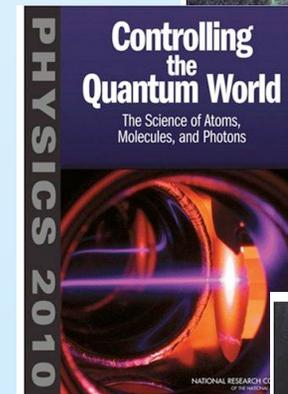

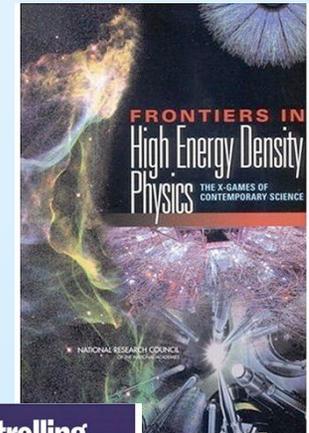

Sep 28th 2006
From *The Economist* print edition

A way of building particle accelerators on a table top

AA R&D has impact on questions posed by National Academies

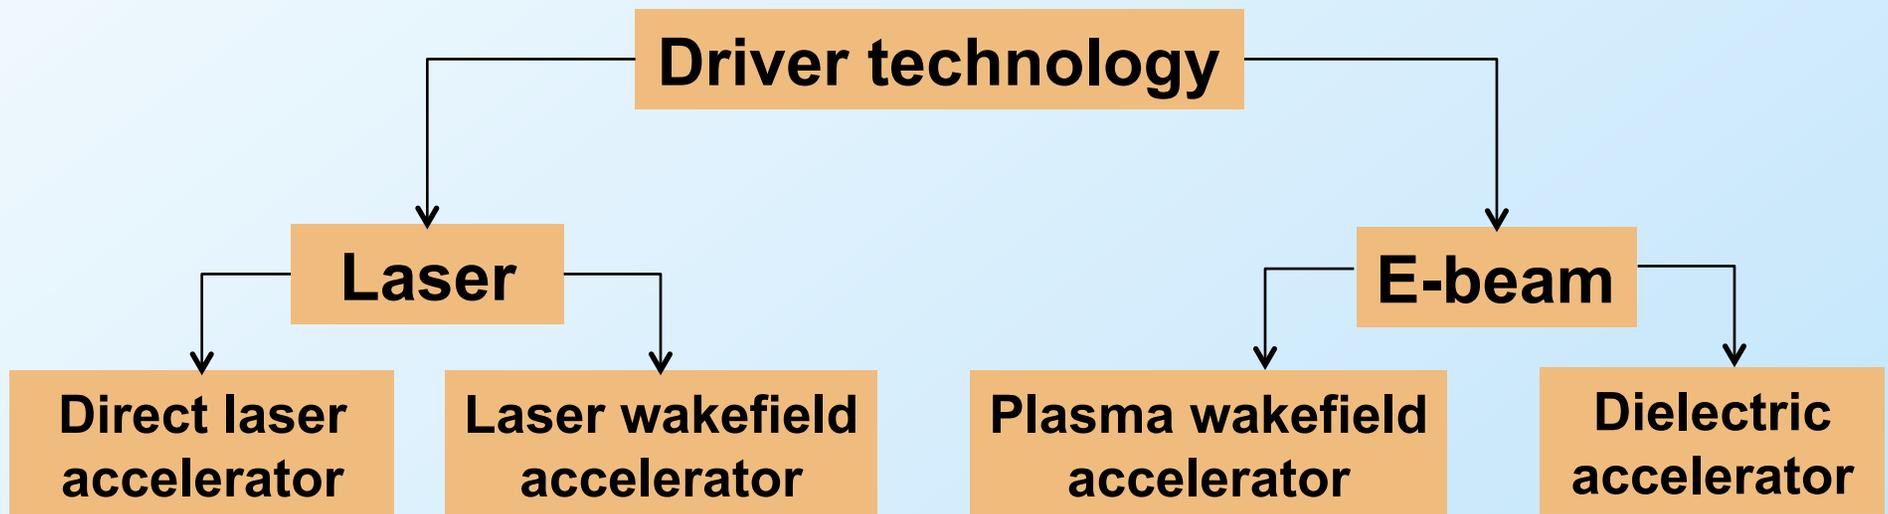

- *How do cosmic accelerators work and what are they accelerating?*
 - *Need better understanding of relativistic plasmas*
- *Is a new theory of matter and light needed at the highest energies?*
 - *QED well tested up to 10^5 Gauss: how about beyond critical field?*
- *Understanding the destiny of the universe*
 - *Detector development from THz to X-rays and training instrumentalists*
- *Exploring extreme physics in the laboratory*
 - *Can we use lasers to build colliders of the future?*

Motivation and overview

- Collider size set by maximum particle energy and maximum achievable gradient limited by breakdown
- Motivates R&D for ultra-high gradient technology

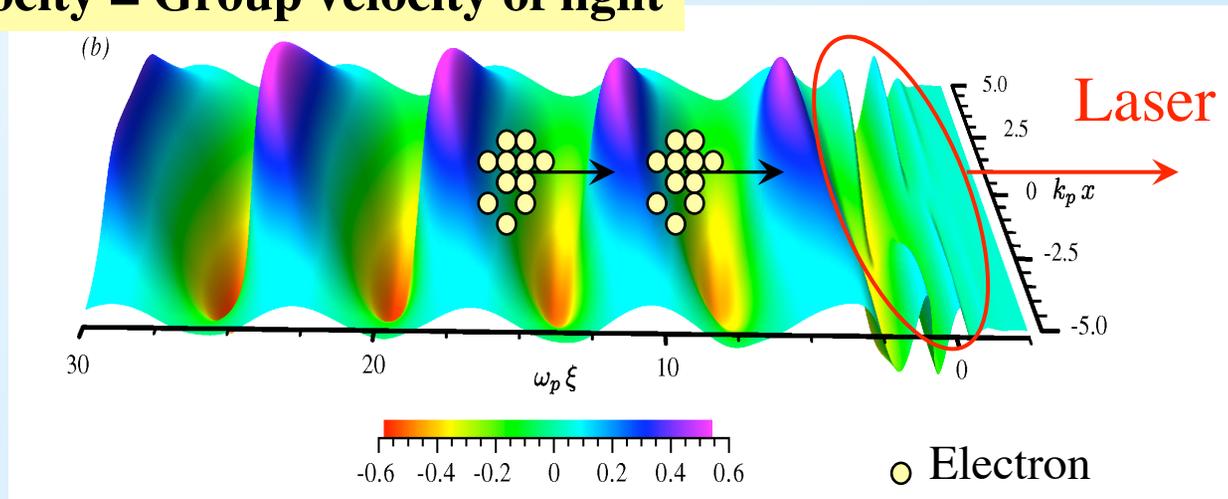

Linear laser/plasma wakefield accelerator

**Boat displaces water
Wake velocity = boat velocity**

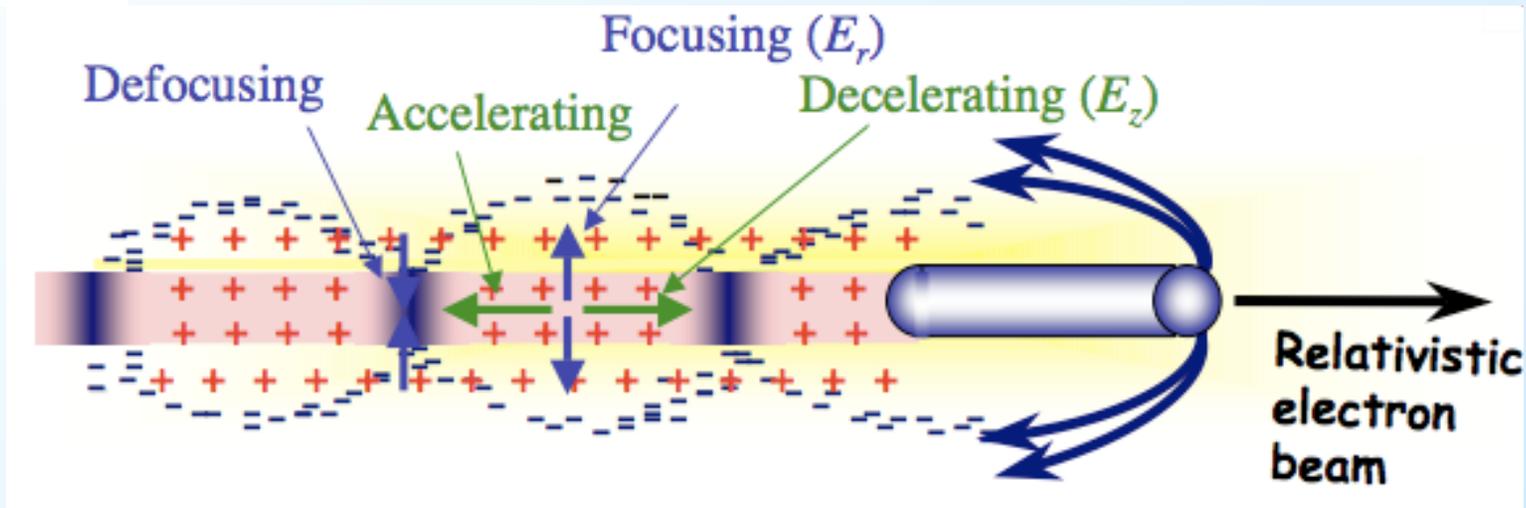

**Laser in plasma displaces electrons
Wake velocity = Group velocity of light**

10's - 100's GV/m, scales as \sqrt{n}

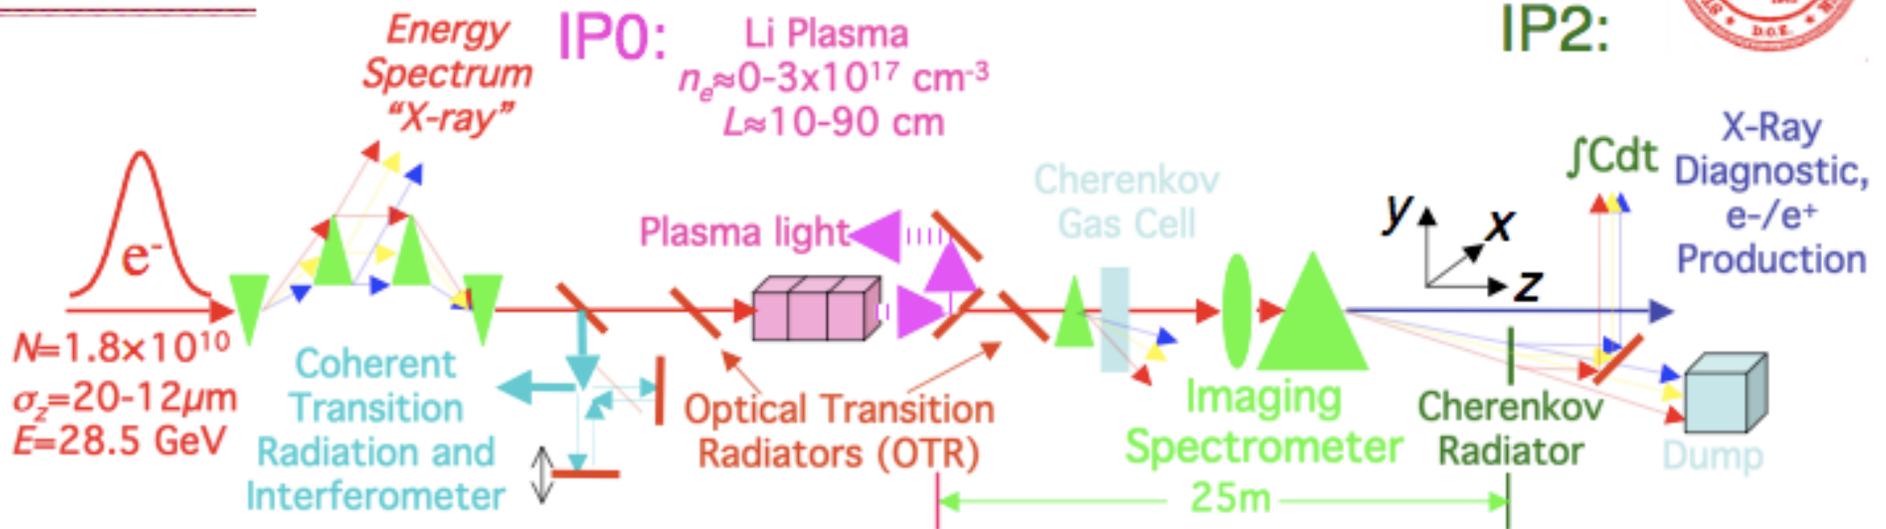

T. Tajima and J.M. Dawson, PRL 1979 ⁵

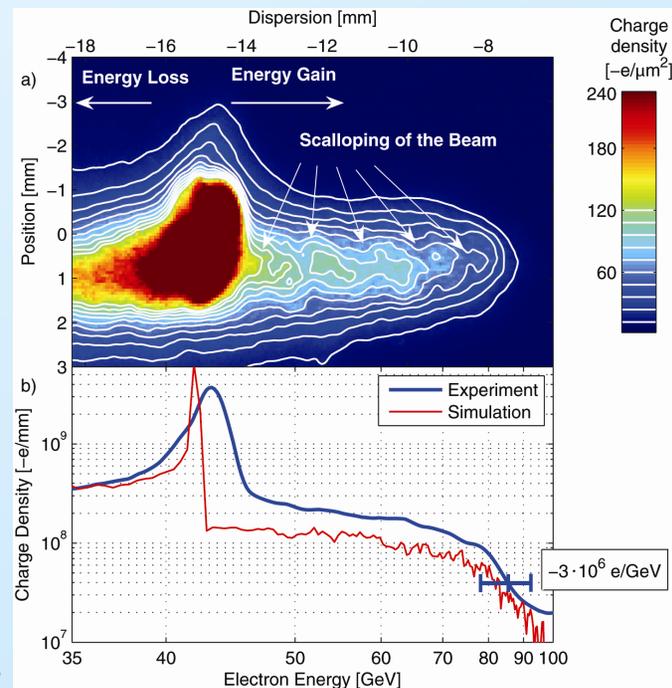

Non-linear laser/plasma wakefield accelerator

- Blow-out or bubble regime
 - Large gradients
 - Self-trapping
- Two major experimental results:
 - GeV with few % $\Delta E/E$ in 3 cm using a laser (LBNL)
 - Up to 85 GeV electrons using a 42 GeV beam (SLAC)

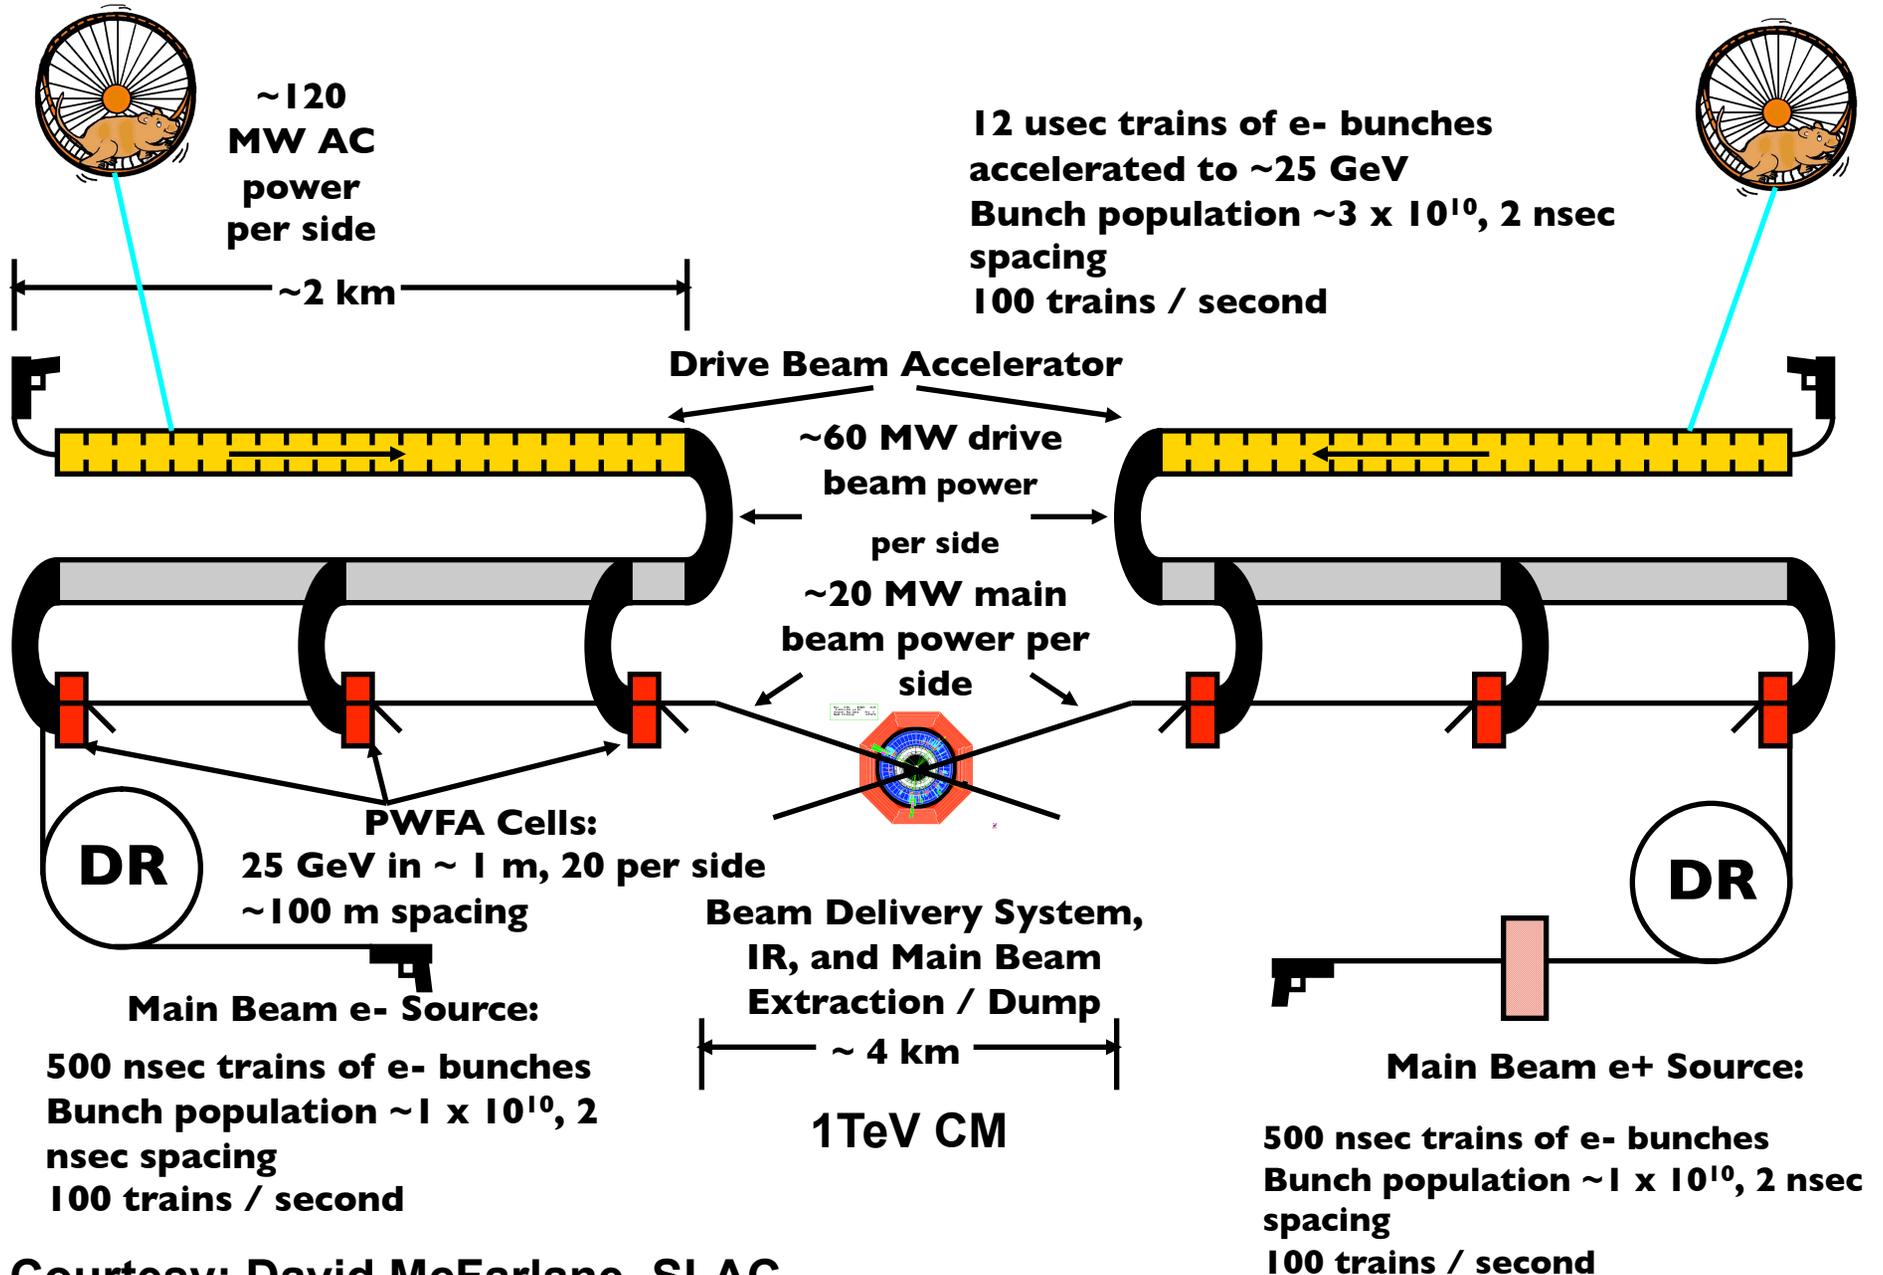

- Used 42 GeV FFTB beam
- Li plasma
- Most electrons decelerated
- Few % accelerated
- Highest energy observed ~ 85 GeV

Blumenfeld et al., Nature 2007

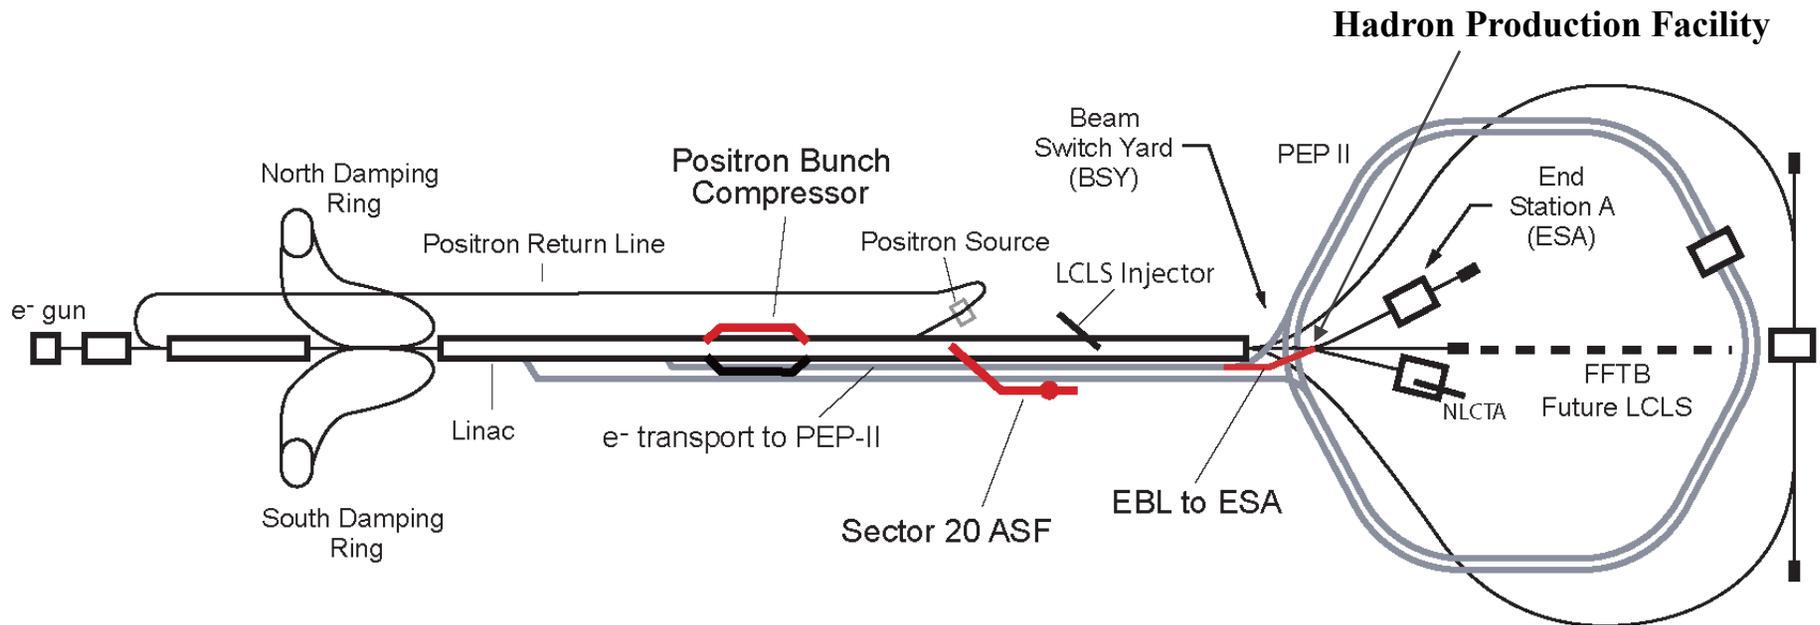

CLIC-like PWFA LC Schematic

FACET Project

FACET project consists of four elements:

- Accelerator Science Facility (ASF) (Sector 20)
- e^+ bunch compressor (Sector 10)
- Electron Bypass Line (EBL) extension to ESA
- Hadron Production Facility in A-Line to ESA

Supports advanced
accelerator R&D

Supports detector &
instrumentation R&D

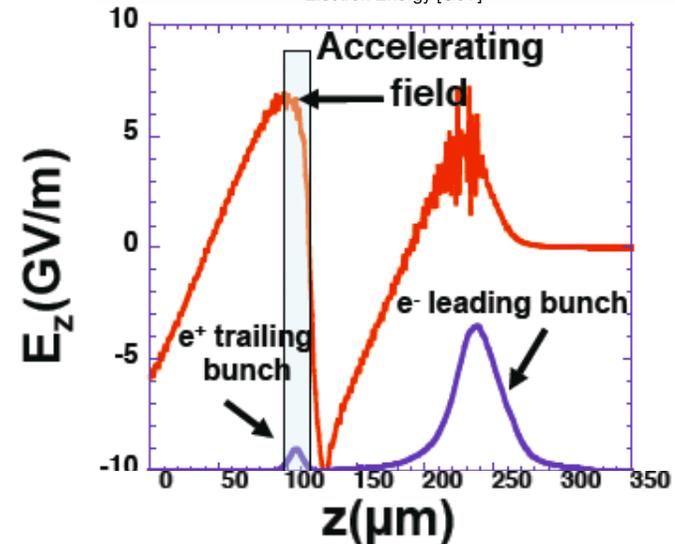

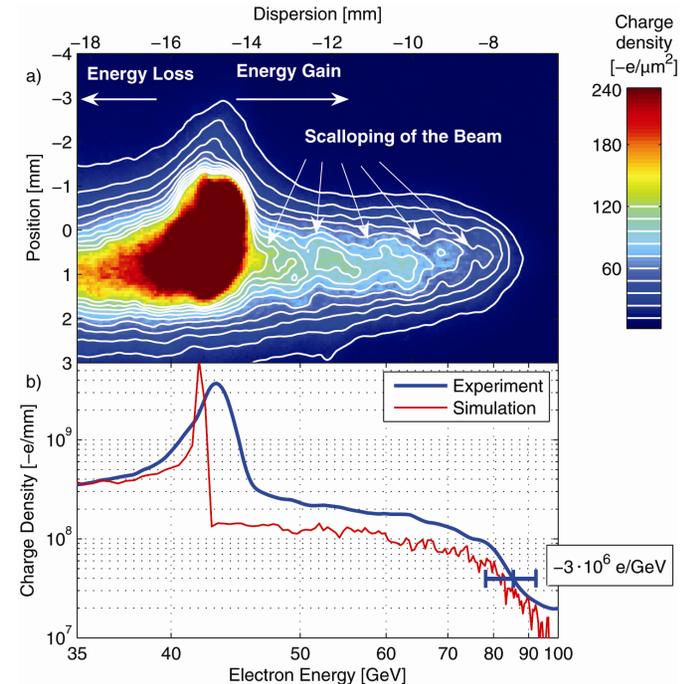

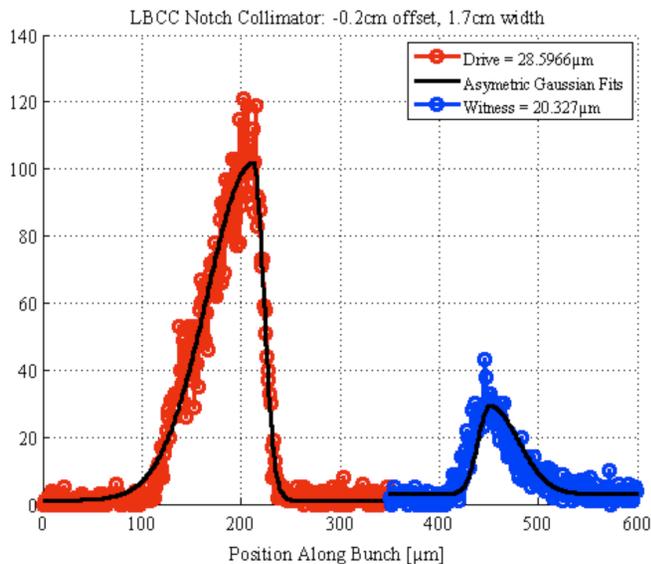

Construction: FY09-FY10 for ~\$11M (ASF) & ~\$17M (full project)

Operations: \$7-9M for 4-6 months/year

Plasma Wakefield Acceleration Studies (ASF)

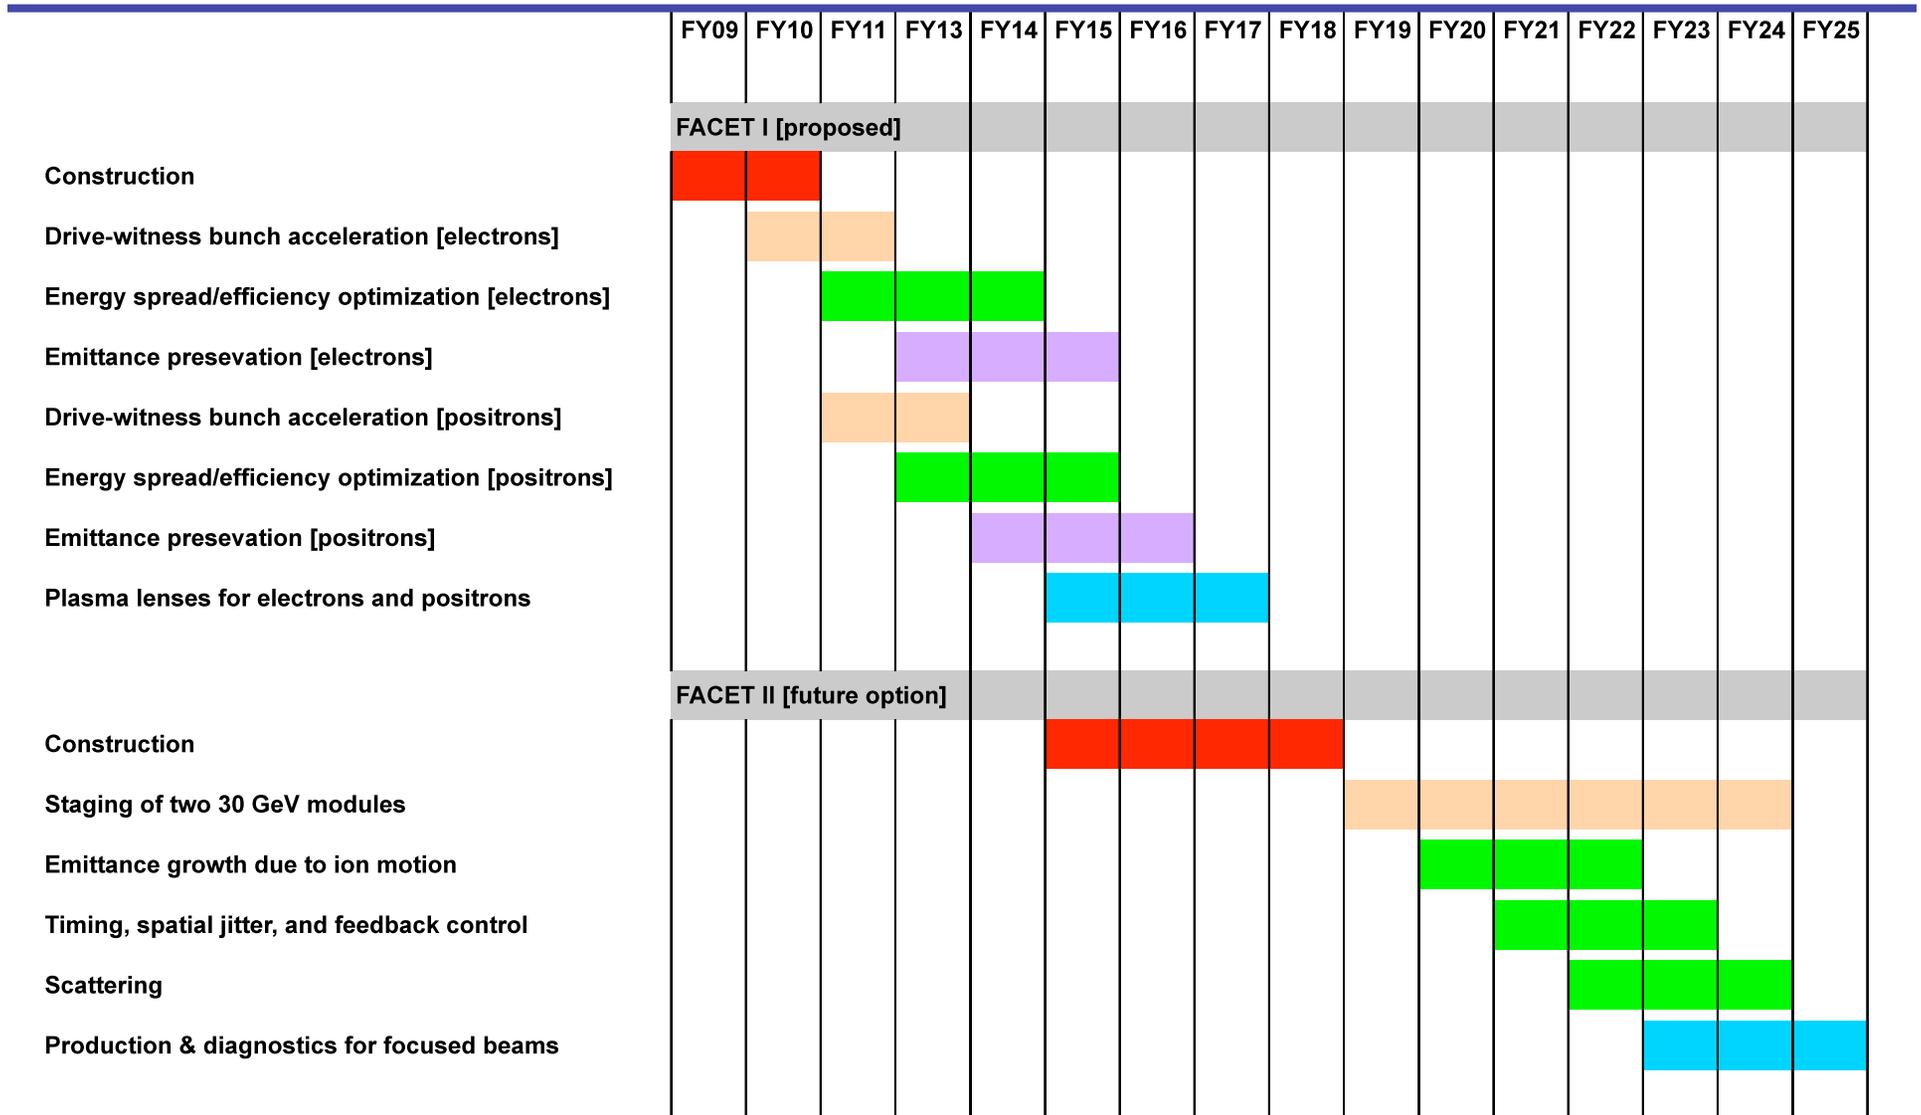

- Electron acceleration
 - Drive-witness bunch
 - Energy spread & efficiency optimization
 - Beam emittance preservation
- Positron acceleration
 - Acceleration mechanism (e^- or e^+ drive bunch, hollow channel)
 - Same program as for electrons

Courtesy: John Seeman/David McFarlane

Possible Timeline for PWFA R&D

E-Beam facilities with AAR&D program

USA:

BNL-ATF: 70 MeV + CO₂ laser

FNAL-A0: 16 MeV with Supercon RF

ANL-AWA: high charge (up to 100 nC)

SLAC-NLCTA and *FACET* (proposed): up to 30 GeV e⁻/e⁺

UCLA-Neptune: <15 MeV, photocathode + CO₂ laser

Asia:

U Tokyo: twin linacs (<30 MeV)

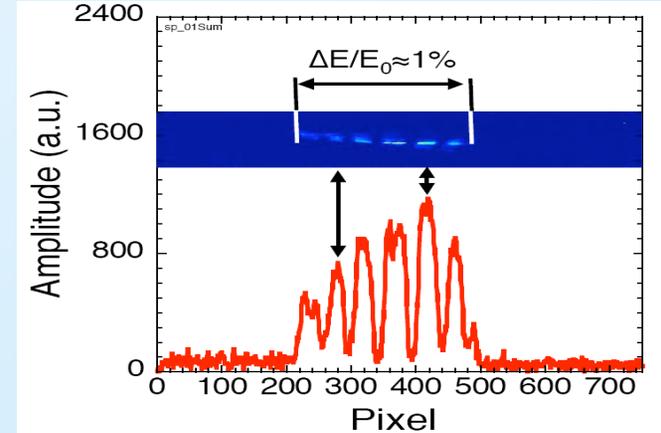

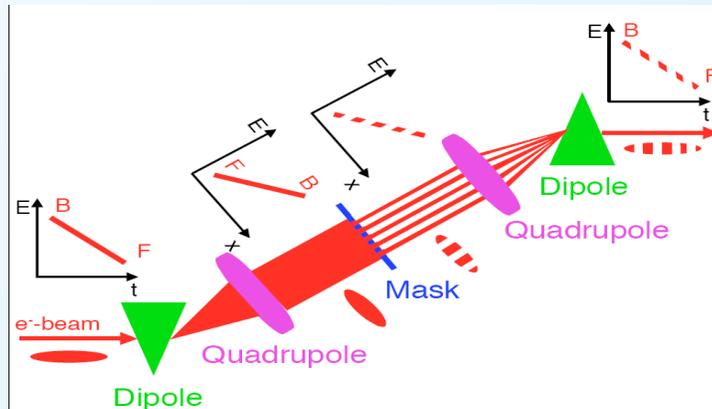

Europe:

CERN: CLIC

TU Eindhoven: photo-injector + laser + plasma_

ATF: pioneering ebeam facility for users

- Example: High gradient acceleration (PWFA) – creation of witness bunch
 - New way to create beam structure suggested and tested at ATF, gradient increase with microbunch number observed. Could produce ILC baseline energy beams from SLAC scale accelerator.

- Proposal-driven, advisory committee reviewed USER FACILITY for long-term R&D
- ATF features:
 - High brightness electron gun (World record in beam brightness)
 - 75 MeV Linac
 - High power lasers (including terawatt CO2 laser at 10.6 mm), beam-synchronized at the picosec level
 - 4 beam lines + controls

Advanced Accelerator R&D Activities at the Argonne Wakefield Accelerator (AWA)—Mission and Research Program

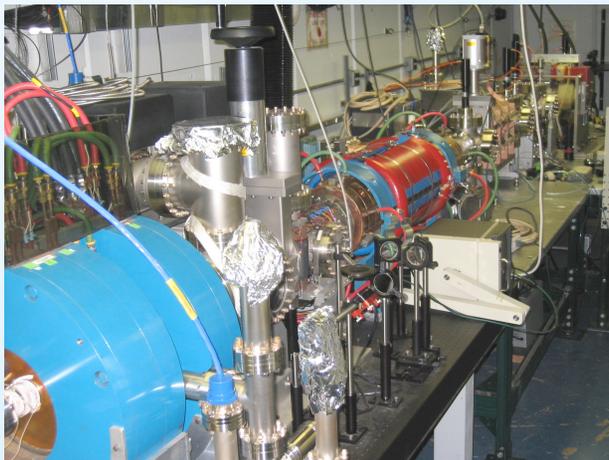

Argonne Wakefield Accelerator (AWA) Facility

- 1.3 GHz RF Photoinjector based facility for the production of high-current and high-brightness electron beams (0.1 – 150 nC/bunch, 15 MeV, 10 Hz).
- 100 MV/m generated, 30 MW in 10 ns RF

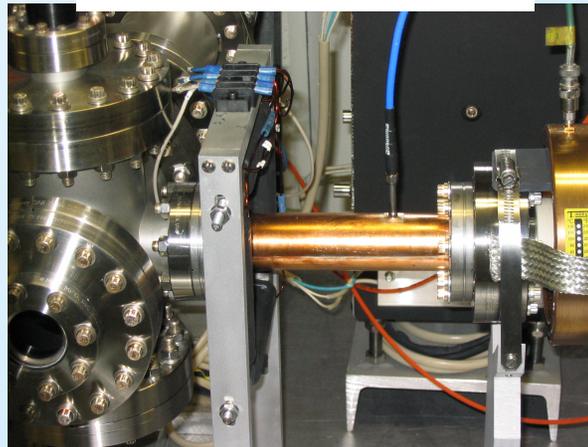

Support of external programs

- Positron source for ILC; Lab Astrophysics; Equipment Testing.
- Providing facilities for collaborator/user's research program (~ 10 Universities and Institutes) and student training (10 Ph.D. students graduated.)

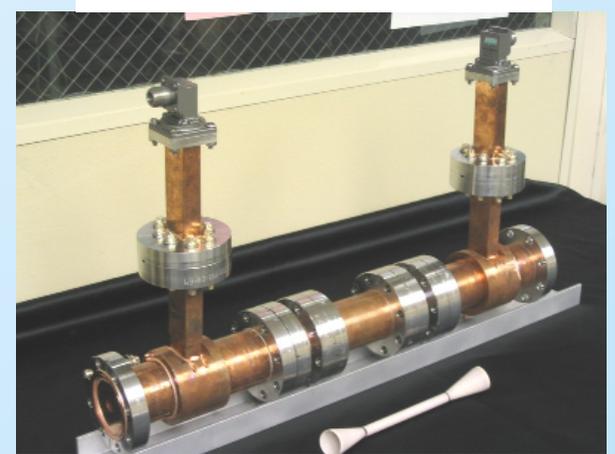

AWA Facility

Dielectric: Structure Under Test

Dielectric Loaded Accelerator

Advanced Accelerator Research: Direct Laser Acceleration (LEAP & E163)

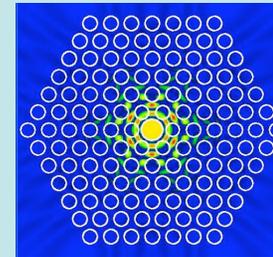

Motivation

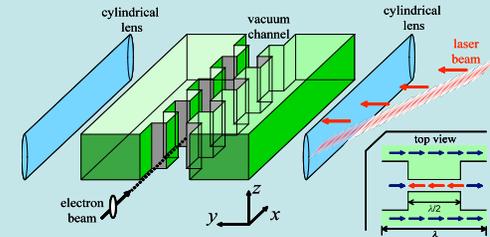

- * **All solid-state** – no plasmas, no klystrons → easier to simulate, more reliable to operate
- * **High gradient** (>0.5 GeV/m) possible with silicon and fused silica structures
- * **High Efficiency** (40% optical-to-beam efficiency structures have been designed, $>20\%$ efficient lasers are commercially available)
- * **Modest laser requirements:** microJoules, not kiloJoules are required due to the high coupling efficiency.
- * **Inexpensive** -- leveraging of commercially available technologies reduces R&D costs; accelerator and its power source can be fully integrated on a single silicon chip making mass production possible

Structure Candidates for High-Gradient Accelerators

Maximum gradients based on measured material damage threshold data

Photonic Crystal Fiber
Silica, $\lambda=1053\text{nm}$,
 $E_z=790$ MV/m

Transmission Grating Structure
Silica, $\lambda=800\text{nm}$,
 $E_z=830$ MV/m

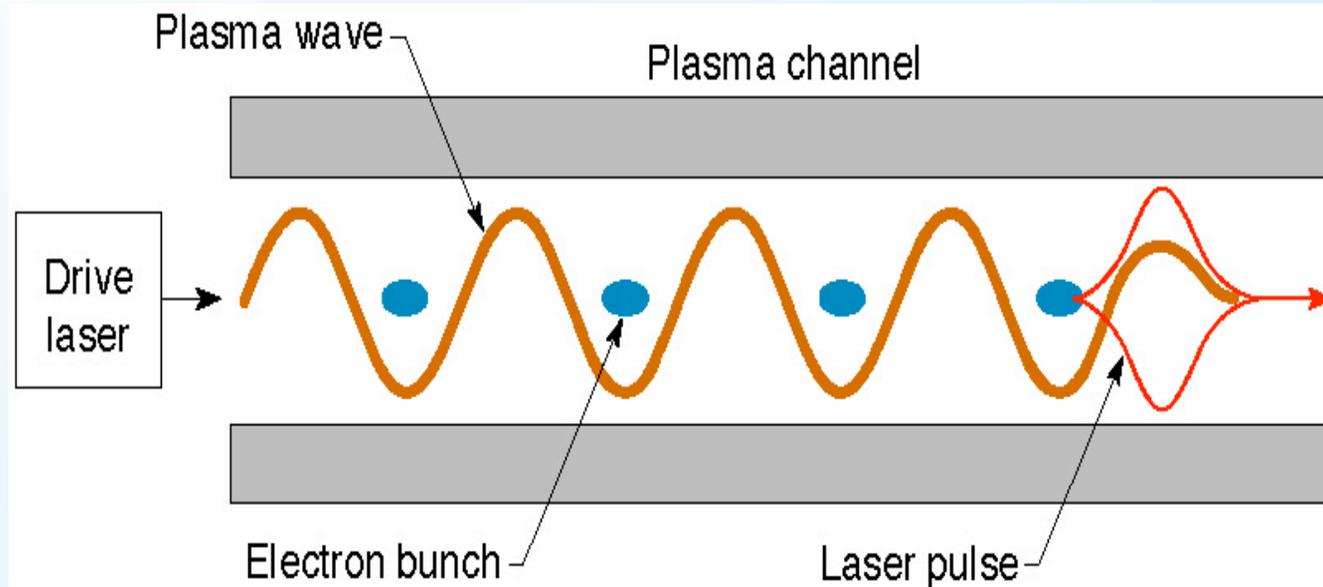

These structures are being simulated and experimentally tested at SLAC.

Strawman parameters for a DLA-based e+e- collider

	$E_{\text{CM}} = 500$ GeV	Laser	JLC/NLC
Luminosity from a laser-driven linear collider must come from high bunch repetition rate and smaller spot sizes , which naturally follow from the small emittances required	N	5×10^6	9.5×10^9
	f_c	50MHz	11.4kHz
	P_b (MW)	10	4.5
	σ_x/σ_y (nm)	0.5/0.5	330/5
Beam pulse format is	N_γ	0.22	1.1
(160 microbunches of $3 \times 10^4 e^-$ in 1 psec) x 50MHz	σ_z (μm)	120	300
→ Storage-ring like beam format → reduced event pileup	σ_z/c (psec)	0.4	1
	ξ_1	0.045	0.11
→ High beam rep rate => high bandwidth position stabilization is possible	L	1×10^{34}	5.1×10^{33}

Courtesy: Eric Colby, SLAC

Building a laser wakefield accelerator using conventional accelerator paradigm

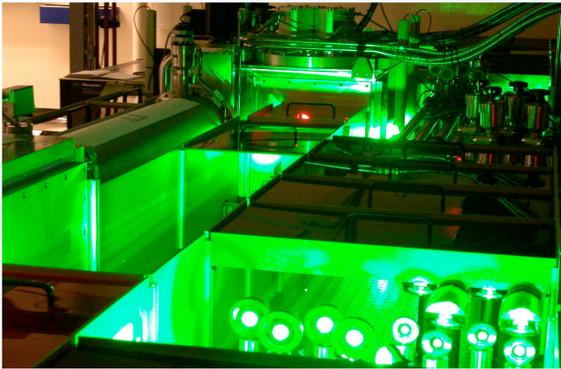

- Drive laser: Ti-sapphire (chirped amplification technology)
- Structure: plasma fiber
- Injection: self-trapped, triggered

Laser accelerator: 1 GeV with 40 TW laser pulse in 3 cm plasma capillary structure

40 TW laser pulse

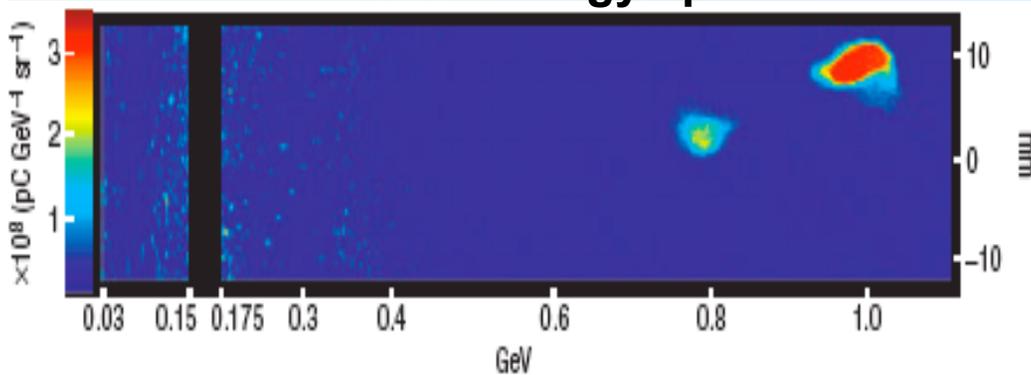

3 cm capillary

Conceptual (strawman) collider lay-out

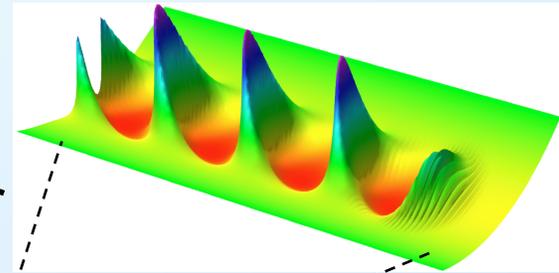

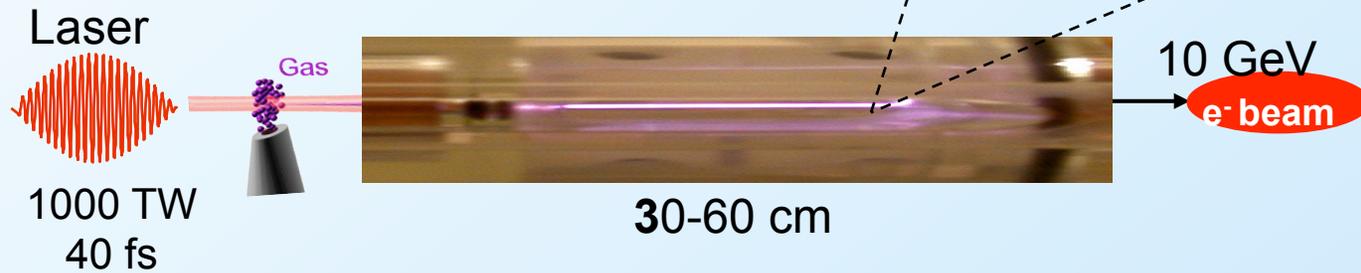

- Technology Challenges:

- Staging technology
- Diagnostics -- control
- Positron and polarized electron sources compatible with laser accelerators
- Emittance and energy spread control (collisions in plasma)
- High average power, high peak power lasers

BELLA = **B**ERkeley **L**ab **L**aser **A**ccelerator

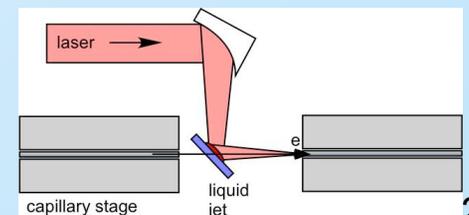

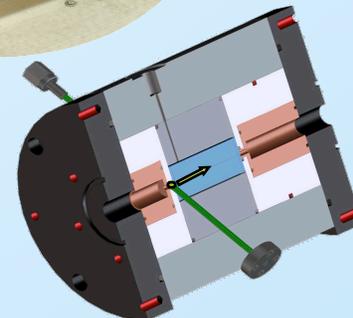

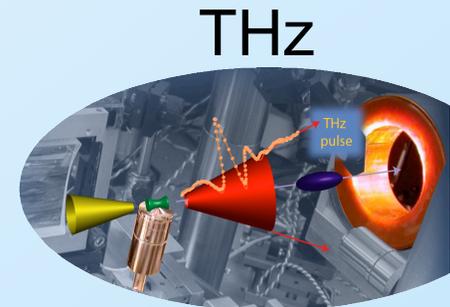

- BELLA Project: 1 PW, 1 Hz laser

- BELLA R&D:

- Diagnostics
- Staged Accelerators

Undulator spectrum

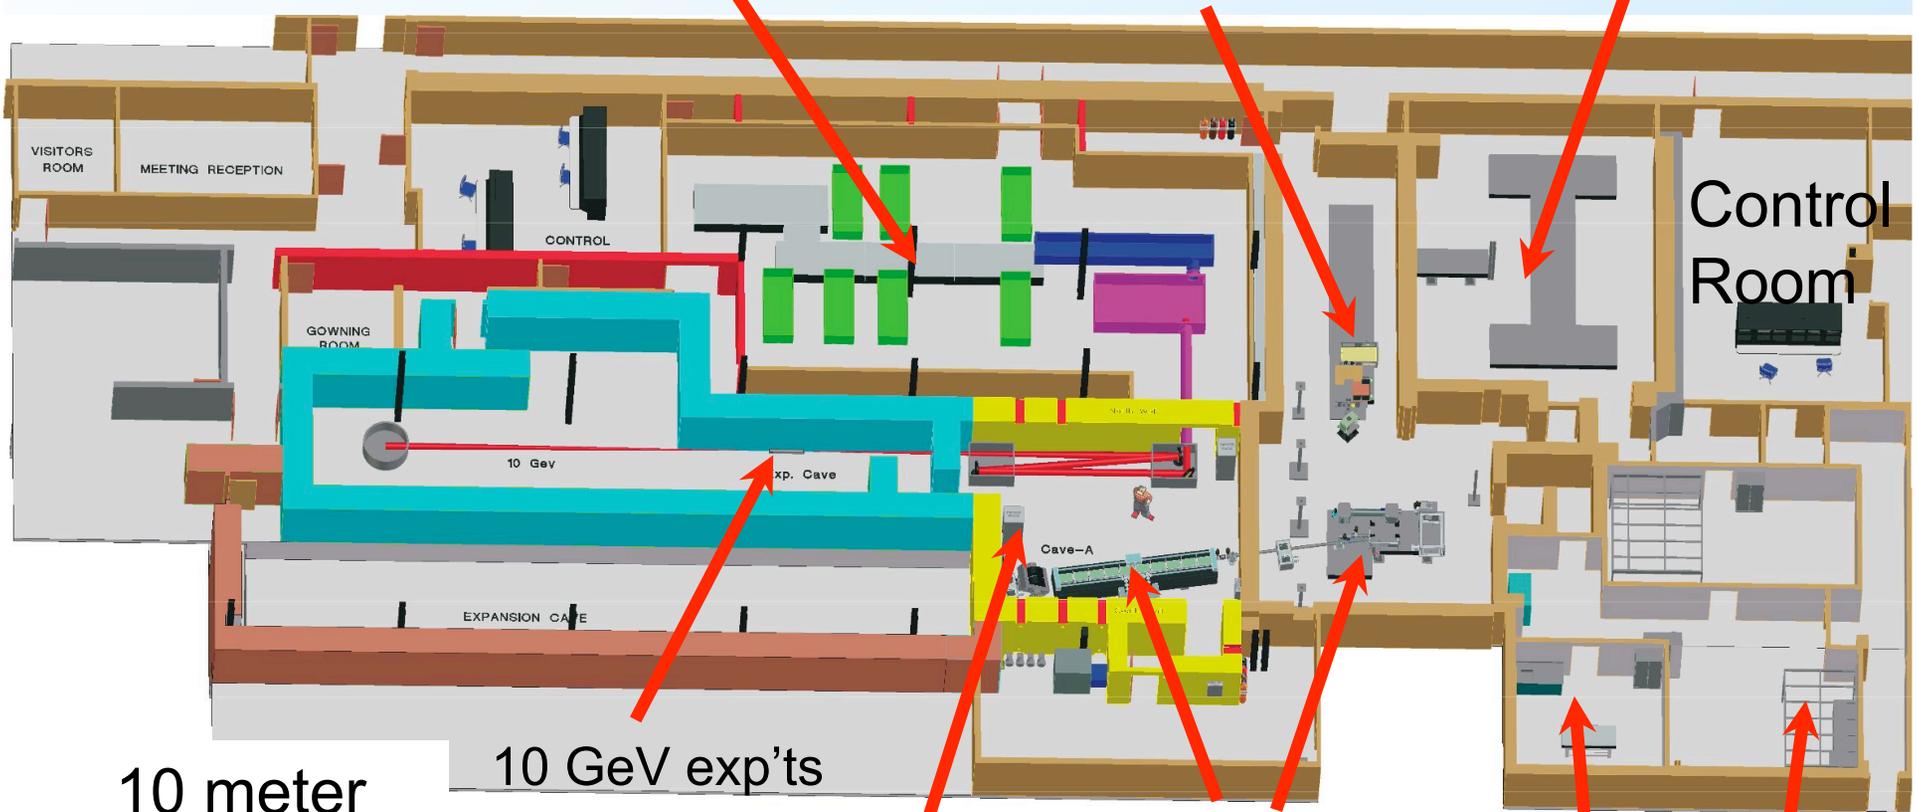

BELLA laser will enable 10 GeV expt's

BELLA 1 PW, 1 Hz laser

10 TW experiments

60 TW, 10 Hz laser

BELLA time lines and budget estimates

- **BELLA Project (2008 – 2011):** Commercial 40 J, 40 fs laser at 1 Hz
Facility to house laser and beamline + laser diagnostics
Total Project Cost: 23-26 M\$
- **BELLA R&D (2008 – 2015):**
 - BELLA OPS: ~ 2M\$/yr
 - Phase space diagnostics
 - Wakefield diagnostics
 - Injection techniques
 - Staging techniques
 - Emittance control
 - Acceleration efficiency
 - 10 GeV stage
 - THz to gamma rays
 - Detector testing

High power lasers for AA R&D

USA

BNL & UCLA: CO₂, single shot, < 1 TW
LBNL: 60TW @ 10 Hz + BELLA (planned)
Michigan: 500 TW @ 1/min
Nebraska: 150 TW @ 10 Hz, upgrade 1 PW
UNR: 100 TW @ 10 Hz
UT Austin: 40 TW @ 10 Hz
UMaryland: 20 TW @ 10 Hz
UCLA: 10 TW @ 10 Hz

Asia

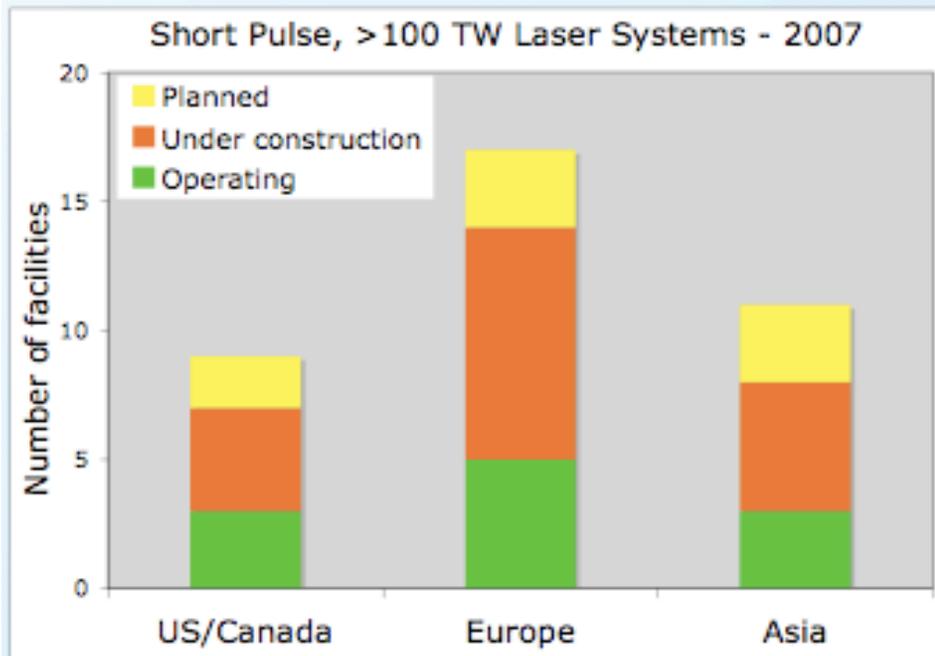

China: > 500 TW + 1 PW in progress
India: 10 TW @ 10 Hz
Japan: 10-100TW @ 10 Hz + 1 PW @ 0.1 Hz
Korea: 200 TW @ 10 Hz

Canada

ALLS: 200 TW @ 10 Hz – commercial

Europe

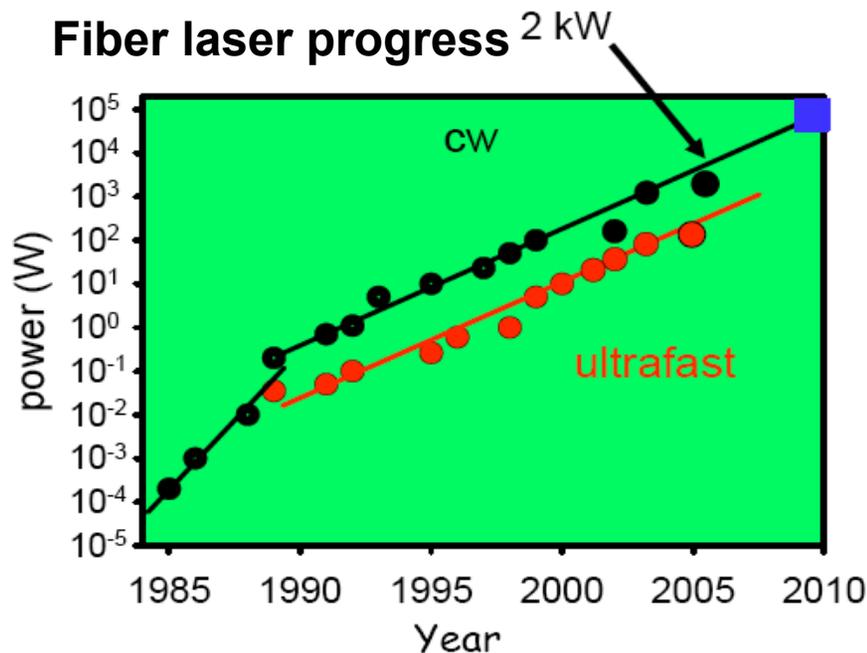

France: LIXAM: 1 PW @ 0.1 Hz
ILE (in progress): 25 PW @ 1/10 min
ELI (planned): 250 PW, single shot
LOA: 60TW @ 10 Hz
Germany: MPQ: 1 PW @ 0.1 Hz
Dusseldorf: 40 TW @ 10 Hz
Rossendorf: 100 TW @ 10 Hz
Italy: INFN: 20 TW @ 10 Hz
Portugal: 100 TW @ 10 Hz
Spain: 100 TW @ 10 Hz
Sweden: Lund: 30 TW @ 10 Hz
UK: RAL/IC/Oxford: 500 TW x 2 @ 0.1 Hz
Strathclyde: 50 TW @ 10 Hz

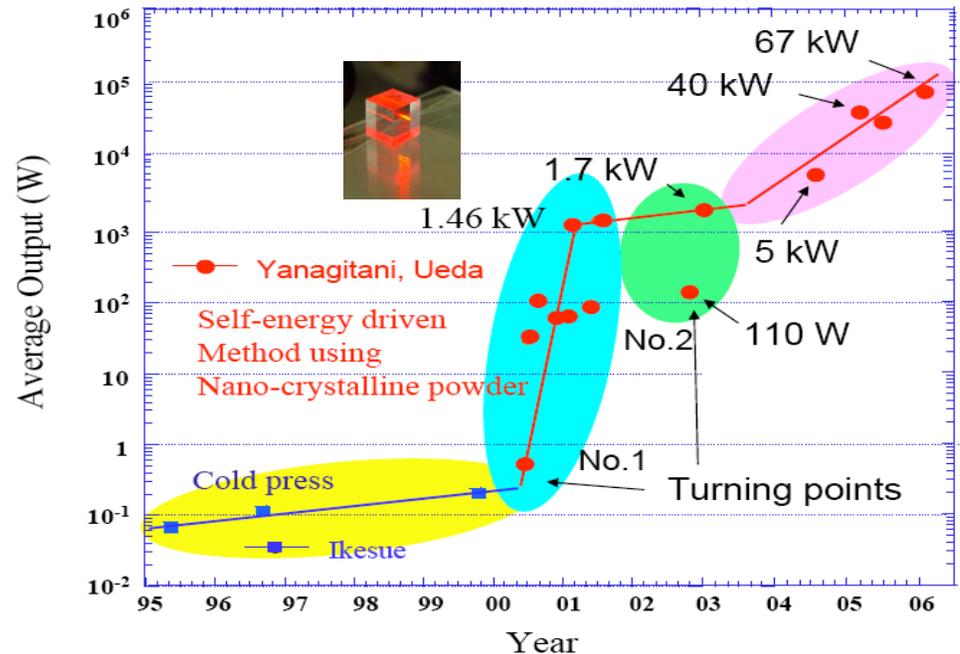

Critical Technology: High average power, high peak power lasers, high wall plug efficiency

- Large core single mode fibers
- Multiplexing, coherent addition
- Ceramic materials

Courtesy: B. Byer

- Emerging market: LED Street lights
 - 50 million lamps in US alone
 - Volume drives down price

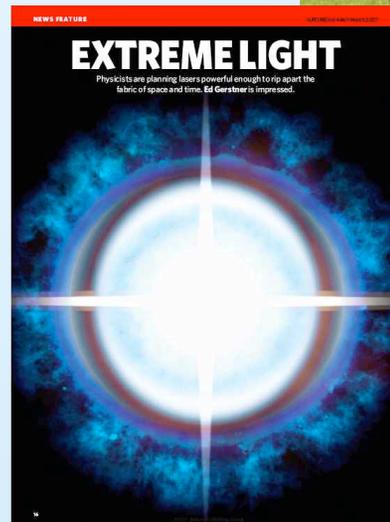

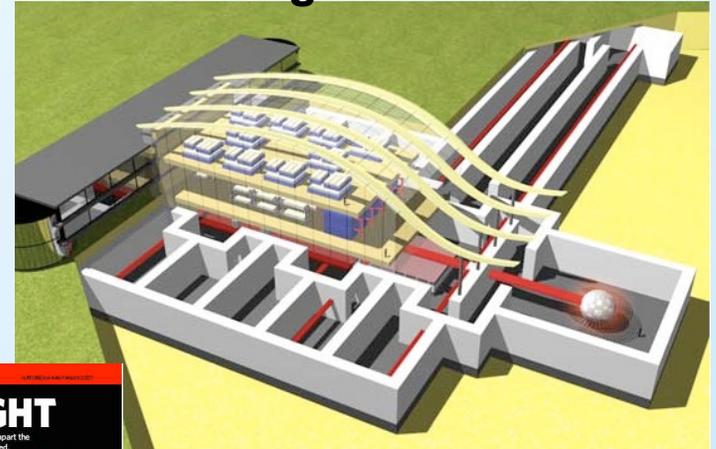

Prospect for kJ, picosecond, multi-kHz systems at 30-50 % wallplug seems possible

Large scale ultra-short pulse facilities are planned outside US

- Example: ELI in France -- 25 PW
- High field science:
 - Photon-photon scattering
 - Gamma ray generation
 - Electron-positron pairs
 - Schwinger field limit
- AMO science:
 - Relativistic High Harmonics
 - Coherent X-rays
- Medical science
 - Phase contrast imaging
 - FEL's

Extreme Light Infrastructure

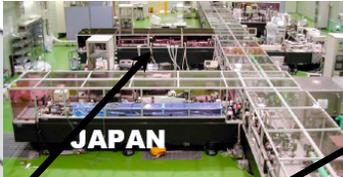

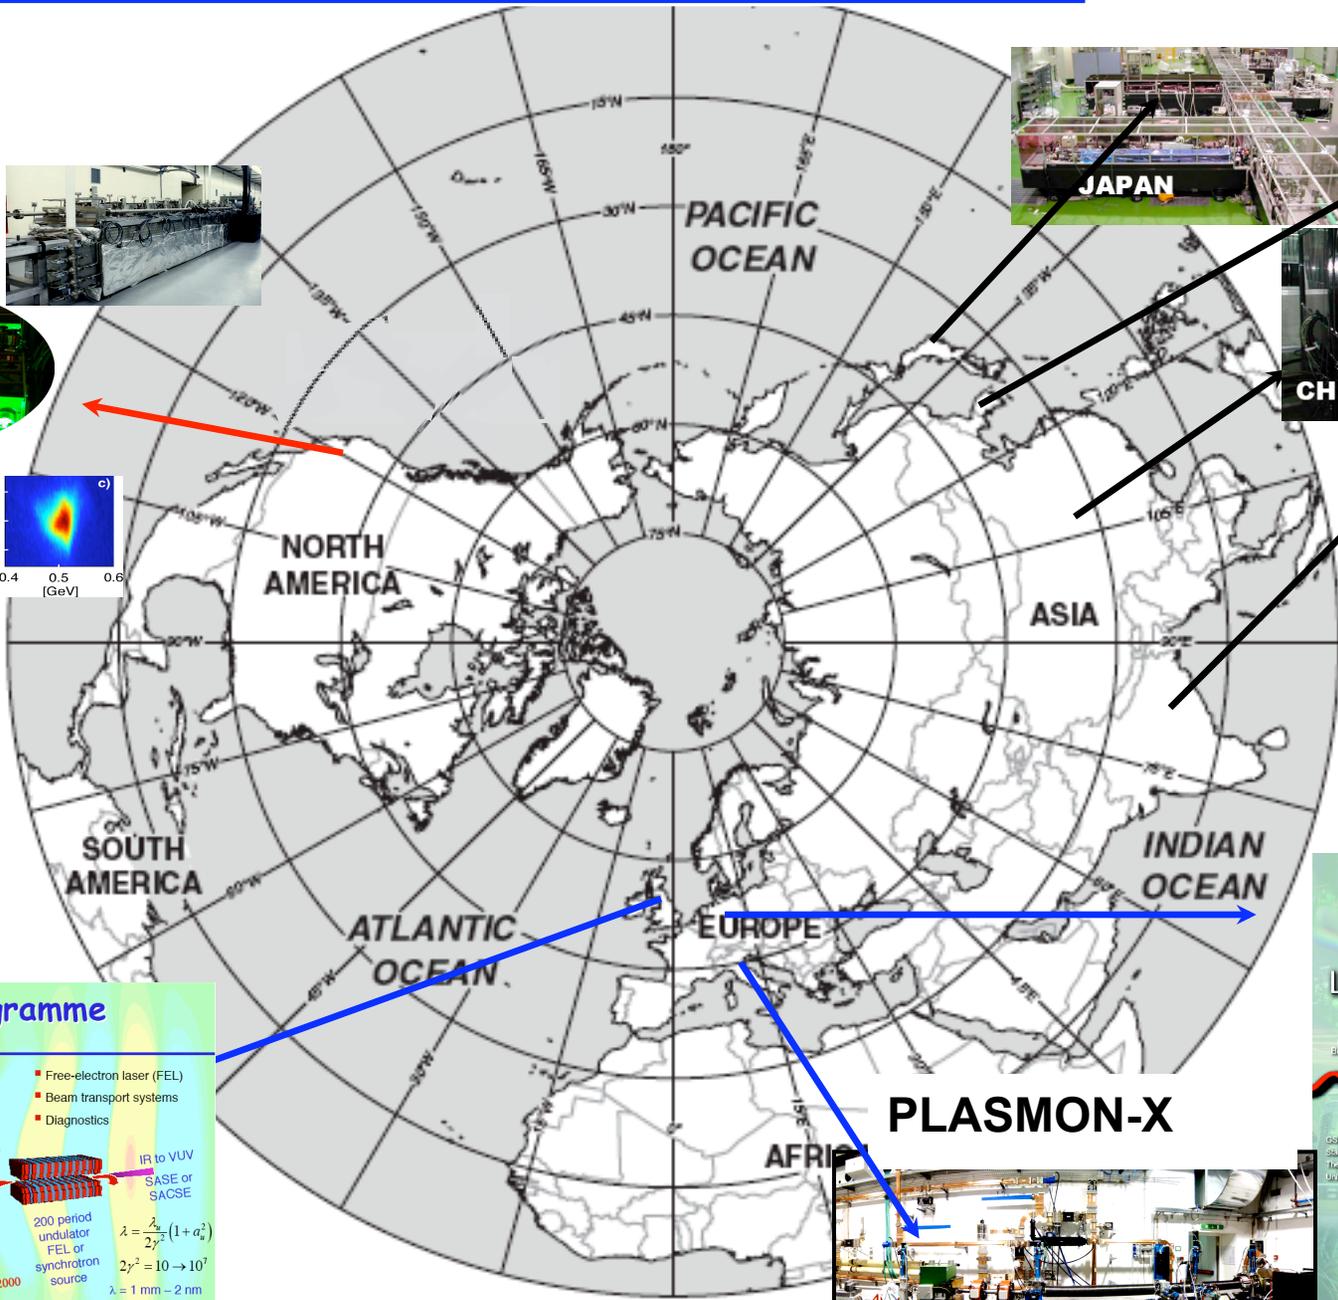

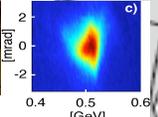

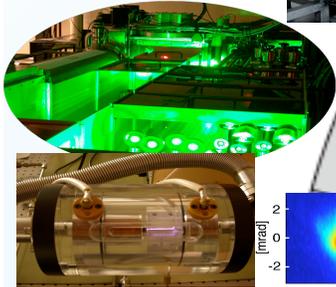

E. Gerstner, Nature 446 (2007)

Excerpt from Jay Marx report (p.82): “ELI has been called a **“science integrator”** that will bring many frontiers of contemporary physics, i.e. relativistic plasma physics, particle physics, nuclear physics, gravitational physics, nonlinear field theory, ultrahigh pressure physics, and cosmology together.”

World-wide effort aimed at FEL using laser accelerator

Main areas of research:

- Injectors (conventional and all-optical)
- Laser-plasma wake-field acceleration
- Plasma capillaries
- Free-electron laser (FEL)
- Beam transport systems
- Diagnostics

optical self-injection
 6.5 MeV photo-injector
 1 J 40 fs 800 nm
 laser
 beam transport
 plasma filled capillary
 wakefield accelerator
 0.1 – 1 GeV
 beam transport
 200 period undulator FEL or synchrotron source
 $\lambda = \frac{2\pi}{2\gamma^2} (1 + a_w^2)$
 $2\gamma^2 = 10 \rightarrow 10^7$
 $\lambda = 1 \text{ mm} - 2 \text{ nm}$
 $\gamma = 200 - 2000$
 IR to VUV
 SASE or SACSE

Advanced Laser-Plasma High-energy Accelerators towards 16-TeV 2005
 Strathclyde Electron and Terahertz to Optical Pulse Source

Summary

- TeV collider is extremely challenging (for any technology), let alone multi-TeV
- Steady, phased approach is needed to address major technological challenges
- Community as a whole will need to become engaged to tackle the challenges
- BELLA and FACET proposed: cornerstone facilities for AA R&D
- Laser and plasma based accelerator technology continues to show promise:
 - GeV beams ($\sim\%$ $\Delta E/E$) demonstrated and 10 GeV is feasible with PW laser
 - Up to 85 GeV electrons obtained in PWFA expt with 45 GeV driver
 - Laser performance continues to improve **but** a long way still to go

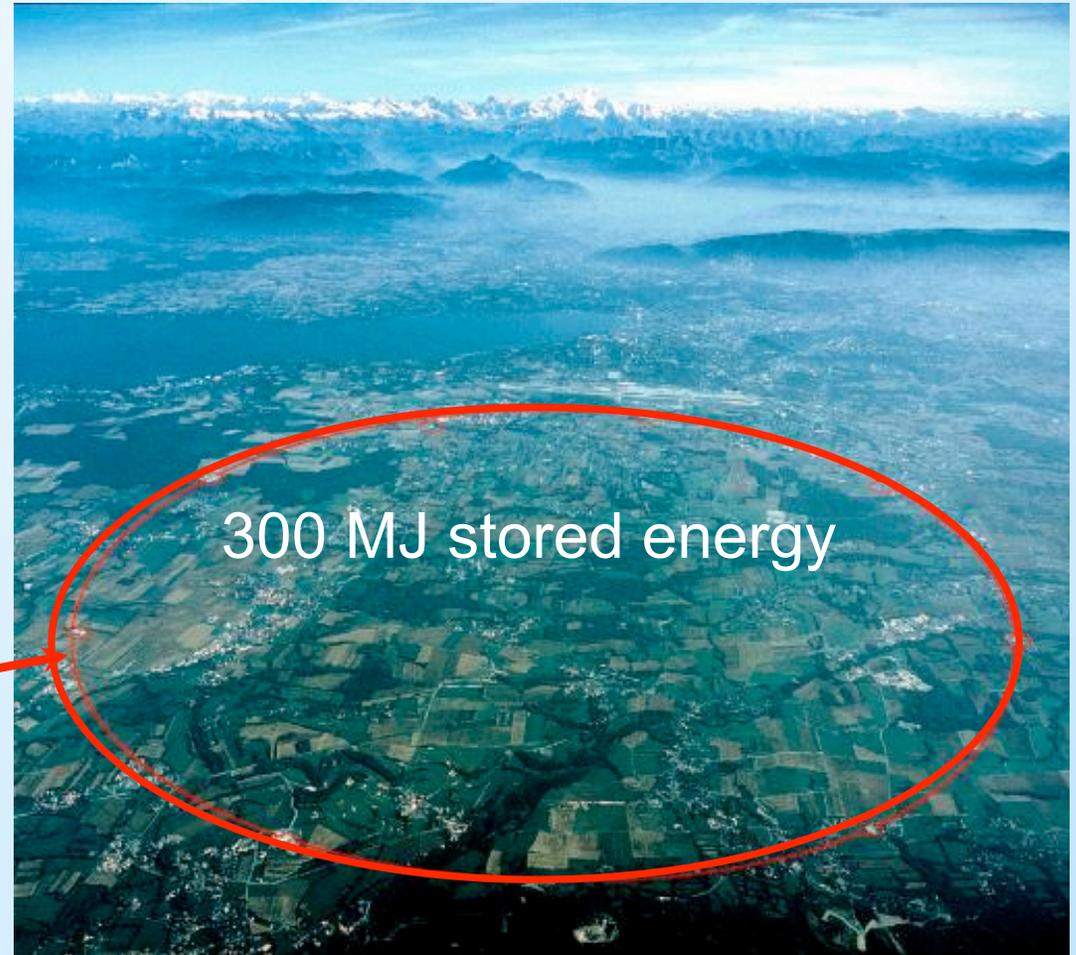

People who say it cannot be done should not interrupt those who are doing it.
