

A Gold Label for Electron Microscopy

For Biophysicist James Hainfeld, Biology Department, what glitters more than gold is a cluster of 11 gold atoms attached to the active part of an antibody.

Like a goldsmith, Hainfeld has crafted a work of art in gold — but one that has scientific value. By coupling an undecagold (Au_{11}) complex and an antigen-binding antibody fragment (Fab'), he has synthesized the smallest antibody label available for use under the electron microscope.

"This marker is five to ten times smaller than the size of antibody labels in current use," states Hainfeld. The new Fab'- Au_{11} label could become the new gold standard of electron microscope labels. It gives structural biologists a golden opportunity to see submolecular sites on proteins, nucleic acids or other molecules at a resolution of about five nanometers, five to ten times higher than possible before with other antibody labels.

This golden marker has already been used as a label for actin, fibrinogen, haptoglobin and other proteins, which were viewed under BNL's Scanning Transmission Electron Microscope (STEM).

Antibodies are proteins that exist naturally in the blood and are produced in response to infection by foreign substances, called antigens. To eliminate the source of infection, antibodies bind to antigens. Because specific antibodies go to specific sites on proteins, they can be used to label those sites for viewing under the electron microscope — if the antibody label can be made to glitter, as it were, like gold.

Gold and other heavy atoms show up under STEM as bright spots. Heavy atoms were first seen under an electron microscope in 1970. However, in trying to use a single heavy atom to label an electron microscope specimen, two problems were encountered.

First, a very high dose of electrons is required for single heavy atoms to be seen, thus partially destroying the biological specimen labeled by the heavy atoms. And second, the microscope's electron beam has enough energy to break bonds, thereby freeing the individual heavy atoms from the sites they are supposed to mark.

So the solution was to use more than one heavy atom bound within an organic molecule. Within the last three years, a derivative of the undeca-

James Hainfeld in his Biology Department laboratory, withdrawing a purified sample of his new, antibody fragment-undecagold complex label for electron microscopy.

gold complex that is soluble in water, as are most biological structures, and that has only one reactive site that reacts with cleaved antibodies was

synthesized. The undecagold derivative, another researcher's golden nugget, became Hainfeld's gold mine. "About five years ago, I had the

idea to label antibodies with heavy atoms," says Hainfeld. "but when the undecagold complex was synthesized, I then thought, 'Why not use it to make the smallest antibody label — using only the active part of an antibody?'"

So first, Hainfeld cleaved antibodies to obtain the active part, the portion that binds to specific antigens at one end and would combine with the undecagold complex at the other. Then, to make the Fab'- Au_{11} label, he reacted the bullion-containing complex with this antigen-binding antibody fragment, which is about one-third the size of a complete antibody.

As the precious metal complex binds at the opposite end of the antibody to which an antigen would bind, the gold does not interfere with the fragment's reactivity, an important consideration. Because it is smaller than conventional antibody labels, it can mark sites previously obscured by the larger labels, which is another advantage.

In developing the procedure for attaching the Au_{11} complex to the Fab' fragment, Hainfeld used an antigen-binding fragment from a specific rabbit antibody. However, from further

Volunteers Needed

Can Calcium Supplements Prevent Osteoporosis?

Millions of milligrams of calcium supplements costing an estimated \$200 million will be swallowed by American women this year in hopes of preventing osteoporosis. The calcium craze began in 1984 when a National Institutes of Health panel on osteoporosis recommended that all Americans consume at least 1,000 milligrams of calcium a day, postmenopausal women at least 1,500. However, no one yet knows whether calcium supplements will prevent osteoporosis, the disease which results when the loss of bone mass that accompanies aging is accelerated.

To find out, Research Collaborator John Aloia, Medical Department, who is Chairman of the Department of Medicine at Winthrop-University Hospital, Mineola, was awarded a nearly \$900,000 grant over five years by the U.S. Department of Health & Human Services. The study will use the newly upgraded Whole Body Counter in BNL's Medical Department, and Research Collaborator Ashok Vaswani will coordinate the research to be performed at the Lab and Winthrop-University Hospital.

The researchers need to recruit several hundred white women who are six-months to three-years postmenopausal to volunteer for the four-year, "Prevention of Postmenopausal Bone Loss (Osteoporosis)" study.

While osteoporosis is rare in women of other races, it affects one out of four white, postmenopausal women. The disease causes the abnormal loss of bone mass resulting in 1.3 million fractures of the hip, wrist, spine, pelvis and ribs each year. One in five women with hip fractures, or 40,000 total, die of complications, making osteoporosis a leading cause of death among older women in the U.S. The medical costs of osteoporosis total \$6 billion a year.

Although it is known that estrogen replacement therapy is at present the most effective treatment for preventing bone loss, it has significant potential risks. Hence the interest in finding out whether or not calcium supple-

ments alone will stop women from getting the disease.

"The major loss of bone calcium in women occurs when they are six-months to three-years postmenopausal," explains Vaswani. "As these women are no longer producing estrogen, we will be able to see the effect of calcium supplements alone in slowing down the rate of calcium loss from the bones. We can then compare it to the effect of estrogen replacement and calcium combined."

Volunteers will be divided among three treatment groups: one that will take only calcium supplements, another taking both calcium and estrogen replacement, and a control group, which will receive a placebo.

After volunteers have consented to participate in this study, they will be screened to see if they are at low or

high risk for osteoporosis, by having the bone calcium in their wrists measured through a non-invasive test, single photon absorptiometry.

Before starting any drug therapy, each woman will have a complete physical examination, including whole-body counting to non-invasively determine her total body calcium. Associate Scientist Joseph Kehayias is responsible for the whole-body counting performed for this study.

While taking medication, the women will be asked to return to the Lab once a year for a whole-body count and twice a year to Winthrop-University Hospital for additional checkups, tests and drug supplies. All tests and drugs required by this study are free to its participants.

If you wish to participate or get further information, call 663-2888.

A comparison in size between a conventional, whole antibody label (below) and James Hainfeld's new, antibody-fragment label. Having an overall dimension of five nanometers, the new label is about one-fifth the size of antibody labels currently in use.

Employees' Resistance to Assistance: Cultural Attitudes May Be at the Root

Drinking that affects job performance is an international and cross-cultural problem. It is also a problem that people from different nations, as well as Americans, can bring to their jobs at the Lab. Unfortunately, employees are often reluctant to seek assistance because of cultural disapproval of psychological treatment.

As Manager of the Employee Assistance Program (EAP), psychologist Jennifer Hill confidentially counsels employees with problems, including alcohol abuse. "I am here to help employees with issues that negatively affect their lives and their work," explains Hill.

Hill offers short-term counseling for those in a crisis and refers those with chronic problems, such as alcoholism, for appropriate and acceptable treatment. After referring employees, she is usually not involved in their therapy, but employees may feel free to discuss their progress with her.

However, as Hill acknowledges, "Cultural attitudes towards the use of alcohol and the use of psychological services often prevent those who could benefit from using the Employee Assistance Program."

Different attitudes of various nationalities and ethnic groups towards alcohol and towards using psychological assistance to overcome its abuse were topics Hill heard more about at the "Third International Symposium on Industrial Alcoholism," in Frankfurt, West Germany, at the end of May.

Says Hill, "Because of the cultural acceptance of alcohol use, European workers get a double message: They are told by their employers not to drink if it is going to affect job performance, yet they are served alcohol in company cafeterias." At BNL, alcohol may not be consumed on site during working hours, unless permission has been granted by the Directorate.

As Hill learned, Europeans in general are more leery of institutional involvement in their personal lives, so they tend not to take advantage of corporate employee assistance programs. In addition, European programs are often not run by independent, psychological counselors, but by personnel or labor union representatives. "Therefore, employees seeking help do not have confidence that their cases will be kept confidential or that they will be counseled by neutral third parties who won't have conflicts of

Psychologist Jennifer Hill (standing) reviews some paperwork from her recent trip to West Germany, to attend the "Third International Symposium on Industrial Alcoholism," with Linda Wasson, Senior Secretary for the Employee Assistance Program.

interest in handling their cases," Hill says.

When employees voluntarily seek help from Hill, she does not report her contact with them to Personnel, their supervisors or anyone else at the Lab. "All phone calls and visits by employees are kept confidential," states Hill.

In addition, in seeking referrals for employees who wish continuing counseling, she must have their written consent before she can discuss their cases with private practitioners. As appropriate, Hill refers employees to psychiatrists, psychologists, psychiatric social workers, hospitals, outpatient clinics and self-help support groups for such problems as alcoholism, domestic violence and divorce, as well as to rehabilitation programs for

drug and alcohol abuse.

"In Europe, rehabilitation programs are longer and full-time," says Hill. "So when an employee returns to work, he has usually lost his former position and his colleagues may ostracize him for his lost time. Therefore, rehabilitation is often regarded as punishment, rather than assistance."

Hill points out that if BNL employees enroll in rehabilitation programs, they may never have to leave work to receive treatment, or if they do, accumulated sick time may be used. Explains Hill, "The idea is to help employees overcome their alcohol or other problems so they can become more productive, not to punish them."

Some Americans also regard re-

habilitation as punishment, and many believe that only "crazy" people need therapy. "Therapy helps you better understand who you are and how the circumstances of your life caused you to be who you are," explains Hill. "With better understanding, you are able to make decisions about your life more easily and live more freely."

Continues Hill, "Therapy, unlike religion, does not teach morals and ethics, but it can help you decide where you stand on whatever issues you wish to decide. A therapist tries to be objective, not judgmental, in order to help you understand your feelings, thoughts and actions and their consequences. The goal of therapy is to help you change what you don't like about yourself."

"Though some ethnic groups believe their members should solve their problems themselves, this is not always possible. Because people's problems transcend individual and cultural differences, it isn't essential to have a therapist of the same ethnic group," adds Hill.

BNL's Employee Assistance Program has been operating since 1981. All regular, full-time employees and eligible part-time employees of BNL, AUI and the Brookhaven Area Office of the Department of Energy may use this service. To make an appointment with Hill, call Ext. 4567.

— Marsha Belford

AA Meetings

Alcoholics Anonymous (AA) meetings are being held at the Lab every Tuesday at 5:30 p.m. All employees, others with current BNL identification cards and their spouses are invited to participate. To find out the location of the meetings, call the Employee Assistance Program, Ext. 2733. As participation in AA is confidential, you will not be asked to identify yourself when making the inquiry.

AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE

SCIENCE

24 APRIL 1987
Vol. 210 • Pages 66-146

A photo by Mort Rosen has once more graced the cover of a scientific publication, this time the 24 April 1987 issue of *Science* (copyright 1987 by the American Association for the Advancement of Science). The cover photo accompanied a report within, by James Hainfeld, on "A Small Gold-Conjugated Antibody Label: Improved Resolution for Electron Microscopy." The picture, much more striking in color as it is on the *Science* cover, is of a pseudocolored electron micrograph showing Fab' antibody fragments linked to 11-gold atom clusters (outer, light spots) and attached to a protein complex called ferritin (center). The image analysis was performed by Assistant Biophysicist Paul Furcinitti, Biology Department.

Gold Label

(Cont'd)

tests of the procedure, using other rabbit and mouse monoclonal antibodies, Hainfeld concludes that the labeling procedure should be applicable to many antibodies, including those of humans.

"Because of its small size, this label will permit the probing of smaller structures and the viewing of structures on a smaller scale," concludes Hainfeld.

By labeling human antibody fragments with radioactive gold, Hainfeld envisions that the Fab'-Au₁₁ marker could be useful for locating, imaging and destroying malignant cells and tumors. He, in collaboration with researchers in the Medical Department, is currently investigating these possibilities.

— Marsha Belford

The reaction scheme for labeling the antigen-binding antibody fragment (Fab') with undecagold (Au₁₁). An antibody (IgG) was broken down with pepsin to yield two Fab' fragments joined by a disulfide bond (SS). Another chemical (DTT) was then used to break the disulfide bond, resulting in two free Fab' fragments. A fragment was then reacted with Au₁₁ to form the Fab'-Au₁₁ label.

In Memoriam

Theodore J. Krieger, a physicist who has been associated with BNL since 1960, died on Saturday, July 4, at the age of 68.

He first came to the Lab in June 1960, for a three-month stay as a Visiting Physicist in the Nuclear Engineering Department, which later evolved into the Department of Nuclear Energy (DNE). He returned in October 1961, to join the staff as an Associate Physicist, and was named Physicist in July 1963. Though Krieger retired in August 1982, he continued his association with DNE as a Guest Scientist until his death.

Krieger was co-author of the 1957 paper, "Slow Neutron Scattering by Molecules," which has proven important in the understanding of thermal reactors. Nuclear-plant safety and the application of statistics to nuclear theory were other areas in which he worked.

He was a resident of Port Jefferson and is survived by two daughters, Judith Levin of San Francisco, California, and Madelon Hotz of Moonachie, New Jersey.

Did you know? Compton House, the men's residence on Woods Road, was named for the U.S. physicist Arthur H. Compton. After sharing the Nobel Prize for Physics with Charles Wilson in 1927, Compton went on to direct the metallurgical laboratory at the University of Chicago, which developed the first self-sustaining atomic chain reaction.

BNL's Fabulous Forty

BNL's "Fabulous Forty" years never would have begun without a suitable site for the new Laboratory. In 1946, when planning for the Lab began, 17 sites in the Northeast were considered. As different criteria were applied to the contenders, they were whittled down to two possibilities: Fort Hancock in New Jersey and Camp Upton on Long Island.

An engineering study of both sites strongly favored Camp Upton, so, exactly 41 years ago, on July 10, 1946, the Board of Trustees of Associated Universities, Inc., officially voted to request that the federal government make the Camp Upton site available for the establishment of a new laboratory.

But before it became BNL, Camp Upton had a noble history all its own. In September 1917, a few months after the U.S. entered World War I, the first draftees began arriving at the new training camp, barely one-third finished and named after Civil War Major General Emory Upton. The Camp Upton trainees eventually became the core of the renowned 77th Infantry Division.

One of the 77th's most famous recruits was Irving Berlin, who remained stateside to write the camp show "Yip, Yip Yaphank." Produced in August 1918 at the Century Theatre in New York City, the show had an all-male cast and featured the hit song, "Oh, How I Hate to Get up in the Morning."

When the war was over, in 1920, the soldiers went home, but the buildings and equipment remained — until August 15, 1921, when most of the 1,660 buildings, utilities and improvements were sold at a public auction.

For the next 20 years the site was relatively quiet. During the Depression, it became Upton National Forest, and the Civilian Conservation Corps planted white pine and fruit trees here.

Camp Upton was resurrected during World War II, as an induction center and rehabilitation hospital.

Sgt. Irving Berlin (center) and two fellow performers in "Yip Yip Yaphank," the play he wrote while at Camp Upton.

Though the barracks of the WWII Camp Upton were recruited as the basis of BNL, they soon were either removed or renovated in favor of facilities more appropriate to a laboratory for basic research. In general, few traces of Camp Upton from either war now remain on site — except at BNL's Exhibit Center.

The Camp Upton Historical Collection, which opened at the Exhibit Center in July 1981, is largely the legacy of Louis Harson, former BNL Principal Architect who died in 1986. Much of the WWI memorabilia in the collection that Harson amassed in his unofficial role as Camp Upton historian came from Marion L. Pond.

Now 90 years old and Deputy National Americanism Chairman for the U.S. Veterans of World War I, Pond first came to Camp Upton when he was discharged from the Army on July 19, 1919. Since then, Pond, who now lives in Hampton Bays, has con-

Summer Tours Feature BNL's Fabulous Forty And Camp Upton, to Boot!

Want to see the Camp Upton Historical Collection? Maybe you're interested in getting a good, overall grasp of the Lab's research — past, present and future. Or perhaps you've been waiting all year to get an inside look at the energy-efficient, prefabricated Danish House.

Whichever aspects of BNL interest you, you're sure to learn more about them on one of the free guided tours of the Lab that will be given from 10 a.m. to 3 p.m. every Sunday, from July 12 through August 30.

The many facets of the Sunday Tour Program have appeal for visitors of all ages and interests. In addition to optional tours of the Danish House, BNL's Sunday guests can view "Quest!" — an audiovisual presentation that tells the story of Brookhaven. They can also take a guided walking tour of the Exhibit Center, a three-story science museum located in Bldg. 701, which originally housed the Brookhaven Graphite Research Reactor, the world's first nuclear reactor built for peacetime research. The reactor was decommissioned in 1968, but its "atomic pile" is still in place and, since 1977, it has served as a dramatic backdrop for the Exhibit Center's lively displays.

The complete Sunday tour program takes about 2½ hours. For more information, call the Tour Program Office, Ext. 4049.

tinued to be involved in many veteran-related activities.

A newspaper article recounting Pond's military service and subsequent activities came to the attention of President Ronald Reagan and, last January, Pond received a letter from the President, who thanked him "... for the good you've done and continue to do for your countrymen ... It's not

quite every day anymore that I can address someone as my senior, so I'd like to offer special congratulations to you for showing everyone just how much a 90-year-old patriot can accomplish."

Pond counts his role in the establishment of the Camp Upton Historical Collection as one of the most important of those accomplishments.

Marion Pond (center) holds the letter he received from President Ronald Reagan. With him are two other World War I veterans: Carl Vail (left) and John Bucci, both of whom trained at Camp Upton.

Advancing Technology In Oil Heat Systems

The most recent advances in research and development of advanced oil heating systems were presented and discussed at the 1987 Oil Heat Technology Conference and Workshop held at the Lab on June 22 to 23. Sponsored by the Department of Energy (DOE), BNL and the Petroleum Marketers Association of America (PMAA), the workshop was attended by one hundred and twenty fuel oil marketers, equipment manufacturers and researchers from across the United States and Europe.

Among the systems on exhibit was the prototype of the Babington Air Atomizer Burner, one of several such devices developed at Brookhaven by the Department of Applied Science's Combustion Equipment Technology Group, led by Roger McDonald. This burner saves energy by replacing the normal flow of oil with an extremely fine spray, making possible a very low firing rate, which uses only from 0.2 to 0.6 gallons of oil per hour. Standing behind the burner are (from left) McDonald, who was responsible for the conference; John Millhone, DOE; Robert Lynch, Empire State Petroleum Association; Richard Cahoon, PMAA; and Daniel Lim, DOE.

Thanks, Blood Donors

Warm thanks go to all the BNLers who came to give blood during the June Blood Drive. The final count was 551 pints of blood collected. Susan Foster, who ran the Blood Drive, also sends a special thank-you to the Blood Drive Captains, whose tireless efforts helped the Lab to pass the goal of 650 people who offered to donate their blood.

Placement Notices

The Laboratory's placement policy is to select the best-qualified candidate for an available position, with consideration given to candidates in the following order of priority: (1) present employees within the department and/or appropriate bargaining unit, with preference to those within the immediate work group; (2) present employees within the Laboratory as a whole; and (3) outside applicants. In keeping with the Affirmative Action plan, selection decisions are made without regard to age, race, color, religion, national origin, sex, handicap or veteran status.

Each week, the Personnel Office lists new personnel placement requisitions. The purpose of these listings is, first, to provide open placement information on all non-scientific staff positions; second, to give employees an opportunity to request consideration for themselves through Personnel; and, finally, for general recruiting purposes. Because of the priority preference policy stated above, each listing does not necessarily represent an opportunity for all candidates. As a guide to readers, the listings are grouped according to the anticipated area of recruitment.

Except when operational needs require otherwise, positions will remain open for one week following publication date.

For further information regarding a placement listing, contact the Employment Manager, Ext. 2882.

OPEN RECRUITMENT - Opportunities for Laboratory employees and outside applicants.

2626. PROGRAMMING POSITION - Requires BSCS and a minimum of two years' programming experience. Thorough knowledge of FORTRAN-77 and some assembly language experience required. Experience with VAX/VMS, VME, real-time systems, Motorola 68000 assembly language and/or "C" preferred. Will be involved in upgrading a data acquisition system for experiment at the AGS. Physics Department.

2627. TECHNICAL POSITION - Requires an AAS in electro-mechanical technology or equivalent. Must have extensive knowledge of helium mass-spectrometer leak-checking techniques. Experience in mechanical and electronic maintenance of leak detectors is essential. Must be capable of independent operations. Accelerator Development Department.

2628. CONTRACTS POSITION - Requires bachelor's degree in business or equivalent and significant experience in all phases of procurement with an emphasis on contract preparation and administration. Will be responsible for drafting RFPs, developing contract modifications, evaluating proposals and analyzing cost and man-hour estimates. (Reposting of Job 2556) Contracts and Procurement Division.

2629. SCIENTIFIC ASSOCIATE POSITION - Requires a BS in biology, chemistry, biochemistry or related field. Will be responsible for data collection and analysis of synchrotron radiation-induced x-ray fluorescence data and routine biochemical and enzymes assays. Experience with computing, spread sheets and biochemical assays required. Knowledge of FORTRAN desirable. Department of Applied Science.
