August 25, 2005

EXECUTIVE SUMMARY

This Closeout Report was developed to document the characterization, remedial work activities, and completion of remedial actions at portions of the Peconic River on Brookhaven National Laboratory (BNL) property and outside BNL property in Suffolk County parklands. The remedial actions were performed in accordance with the *Operable Unit V Peconic River Record of Decision* and include the excavation and off-site disposal of contaminated sediments and the restoration of affected areas in the Peconic River. Approximately 14,025 linear feet (2.66 miles) of the Peconic River were remediated between the Brookhaven National Laboratory (BNL) Sewage Treatment Plant (STP) and just downstream of Manor Road in Manorville, New York, encompassing a riverbed area of approximately 19.8 acres. On BNL property remedial work activities commenced in May 2004 and were completed in September 2004. Remedial work activities resumed in September 2004 for off BNL property areas and were completed in May 2005.

Based upon the sediment characterization risk assessment data, mercury was selected as the contaminant of greatest concern. Mercury bio-accumulates in fish and creates a potential human health risk. The sediment also contained elevated levels of silver, copper, polychlorinated biphenyl (PCB) aroclor-1254, and radionuclides. The heavy metals, PCBs, and radionuclides would be removed during removal of the mercury-contaminated sediment. In all sections of the river requiring cleanup, mercury and the above co-located contaminants were substantially reduced in concentration.

On Laboratory property, the response actions described in the Record of Decision for removal of sediment on BNL property established a cleanup goal to reduce the average mercury concentrations in the Peconic River to less than 1 part per million (ppm) with a goal that all mercury concentrations in the remediated areas would be less than 2 ppm. The cleanup achieved the remedial objectives by reducing the average mercury concentration on BNL property to 0.2 ppm with all samples less than 2 ppm.

Outside BNL property and upstream of Schultz Road, the response actions described in the Record of Decision for removal of sediment outside BNL property established a cleanup goal to reduce the average mercury concentrations in the Peconic River to less than 0.75 ppm, with a goal that all mercury concentrations in the remediated areas would be less than 2 ppm. The cleanup achieved the remedial objectives by reducing the average mercury concentration outside BNL property and upstream of Schultz Road to 0.092 ppm with all samples less than 2 ppm.

Outside BNL property and immediately upstream and downstream of Manor Road, the response actions described in the Record of Decision for sediment removal for the Peconic River sediment in the Manor Road area established a cleanup goal that all mercury concentrations in the remediated areas are less than 2 ppm following the cleanup. The cleanup achieved the remedial objectives by reducing the average mercury concentration immediately upstream and downstream of Manor Road to 0.19 ppm with all samples less than 2 ppm.

1.0 INTRODUCTION

1.1 Purpose

The purpose of this Closeout Report is to document the characterization, remedial work activities, and completion of remedial actions at portions of the Peconic River on Brookhaven National Laboratory (BNL) property (Phase 1) and outside BNL property (Phase 2). The remedial actions were performed in accordance with the *Operable Unit V (OU V) Peconic River Record of Decision (ROD)* (DOE, 2004) and include the excavation and off-site disposal of contaminated sediments, and the restoration of affected areas in the Peconic River at BNL and outside the BNL property in Suffolk County parklands. Approximately 14,025 linear feet (2.66 miles) of the Peconic River were remediated between the Brookhaven National Laboratory (BNL) Sewage Treatment Plant (STP) and just downstream of Manor Road in Manorville, New York, encompassing a riverbed area of approximately 19.8 acres. Phase 1 remedial work activities commenced in May 2004 and were completed in September 2004. Remedial work activities resumed in September 2004 for Phase 2 and were completed in May 2005.

This Report not only serves as the Closeout Report for the Peconic River Remedial Action, but also serves as the Completion Report for the Peconic River Removal Action for sediment outside BNL property as well as documenting the on-site remedial activities from the *Final Completion Report, Peconic River Remediation On BNL Property* (Envirocon, 2005b).

The scope of the remedial work was outlined in detail in the *Peconic River Remediation Project, Phase 1 – On-Site Areas, Work Plan* (Envirocon, 2004a) and the *Peconic River Remediation Project, Phase 2 – Off-Site Areas, Work Plan* (Envirocon, 2004b).

The objectives for remediation of the Peconic River under Phase 1 (on BNL property) were outlined in the *Action Memorandum for the Peconic River Removal Action for Sediment on BNL Property* (*On-Site Action Memorandum*) (BNL, 2004a) as defined below:

- Reduce site-related contaminants (e.g., mercury) in sediment to levels protective of human health;
- Reduce or mitigate, to the extent practical, existing and potential adverse ecological effects of contaminants in the Peconic River; and,
- Prevent or reduce, to the extent practical, the migration of contaminants off the BNL property.

The objectives for remediation of the Peconic River under Phase 2 (outside BNL property) were outlined in the *Action Memorandum for the Peconic River Removal Action for Sediment Outside BNL Property* (*Off-Site Action Memorandum*) (BNL, 2004b) as defined below:

- Protect human health through the reduction of BNL-related contaminants (e.g., mercury) in sediment;
- Reduce or mitigate to the extent practical, existing and potential adverse ecological effects of contaminants in the Peconic River; and,
- Prevent or reduce, to the extent practical, the migration of contaminants from locations outside BNL property to other areas where risk may be unacceptable.

The ROD adopted the remedial action objectives of the two removal actions as final.

1.2 Site History and Regulatory Framework

The U.S. Army occupied the BNL site, formerly Camp Upton, during World Wars I and II. Between the wars, the Civilian Conservation Corps operated the site. It was transferred to the Atomic Energy Commission in 1947, to the Energy Research and Development Administration in 1975, and to the U.S. Department of Energy (DOE) in 1977.

In 1980, the BNL site was placed on the New York State Department of Environmental Conservation (NYSDEC) list of Inactive Hazardous Waste Sites. On December 21, 1989, the BNL site was included on the Environmental Protection Agency (EPA) National Priorities List because of soil and groundwater contamination that resulted from past BNL operations. Subsequently, the EPA, NYSDEC, and DOE entered into a Federal Facilities Agreement (herein referred to as the Interagency Agreement; [IAG]) that became effective in May 1992 (Administrative Docket Number: II-CERCLA-FFA-00201) to coordinate the cleanup. The IAG identified areas of concern that were grouped into operable units to be evaluated for response actions. The IAG required a remedial investigation/feasibility study for Operable Unit V, pursuant to 42 United States Code (USC) 9601 et seq, to meet Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) requirements. The IAG also requires cleanup actions to address the identified concerns.

BNL's *Site Baseline Report* (SAIC, 1992) grouped the identified areas of concern (AOCs) into seven operable units (OU); several OUs were subsequently combined. The OUs and AOCs at BNL are shown on Figure 1-1. This closeout report references the remedial action for AOC 30 (Peconic River) within OU V. Operable Unit V is located in the northeastern quadrant of the property along the eastern property border, as shown in Figure 1-2. The other AOC's in OUV,

AOC 4 (Sewage Treatment Plant), AOC 21 (Sewer Lines), and AOC 23 (Offsite Tritium Plumes, Southern and Eastern) were addressed during the remedial action of the Sewage Treatment Plant.

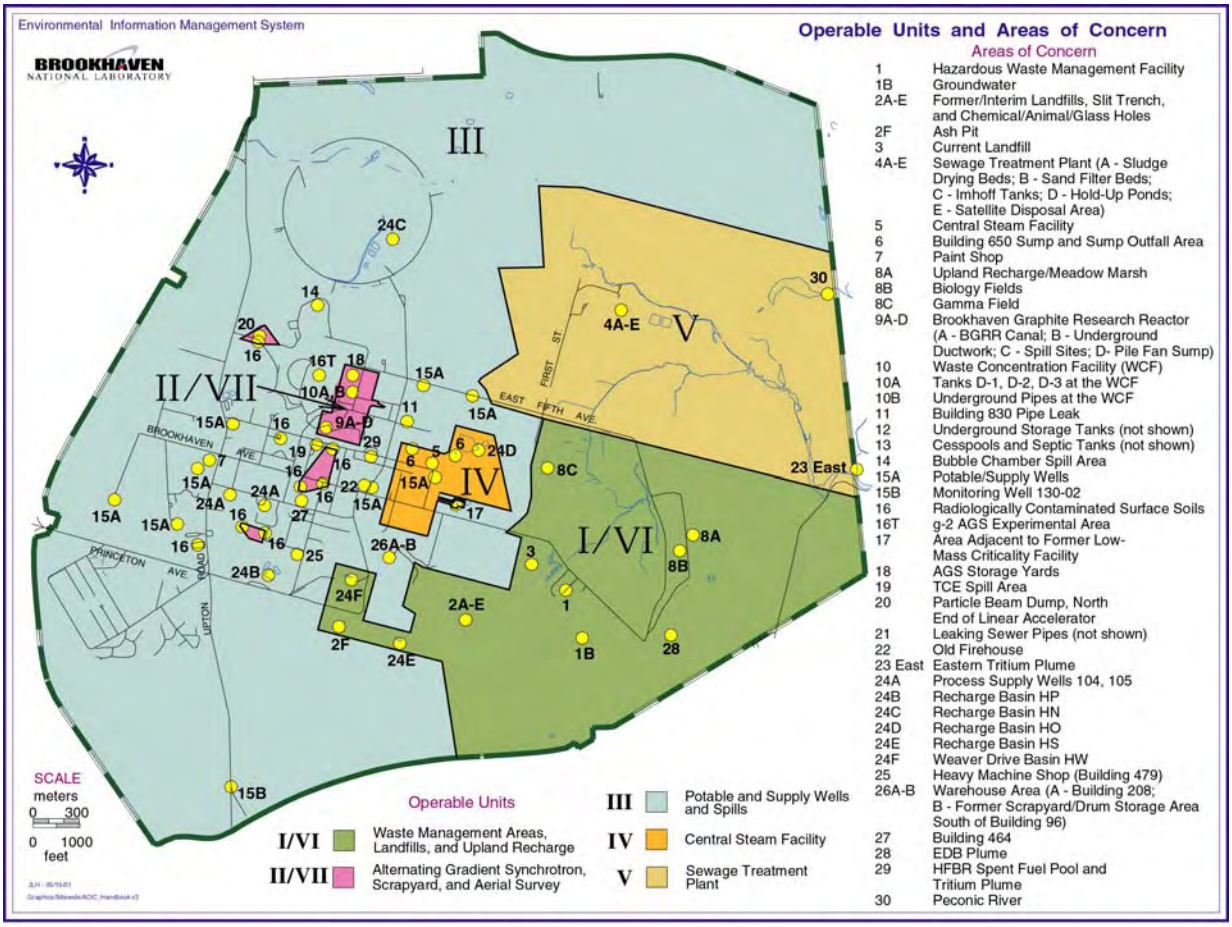

Figure1-1: BNL Operable Units and Areas of Concern

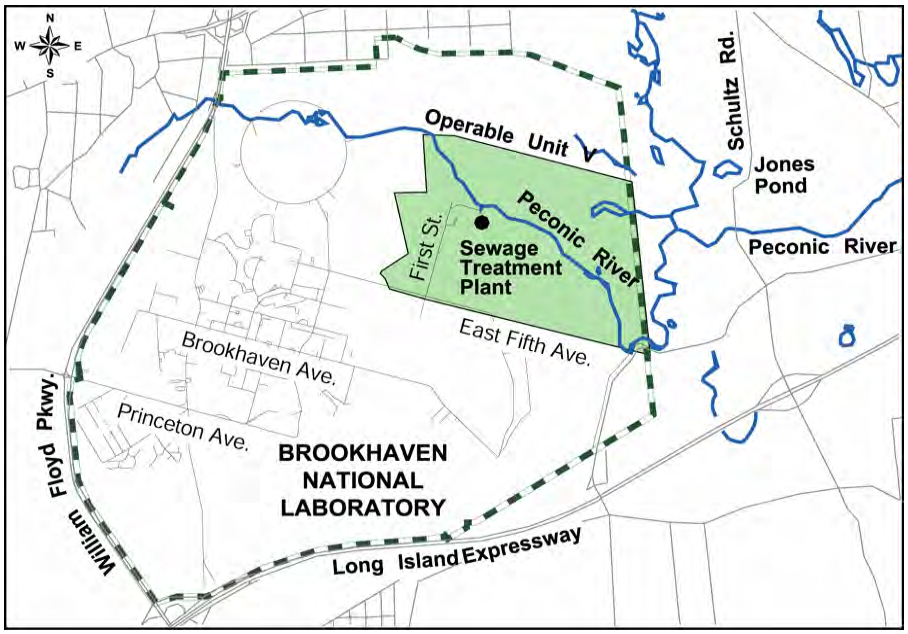

Figure 1-2: Operable Unit V at BNL

The nature and extent of contaminated sediment in the Peconic River have been addressed in the *Operable Unit V Remedial Investigation Report* (IT Corporation, 1998), the *Plutonium Contamination Characterization and Radiological Dose and Risk Assessment Report* (IT Corporation, 2000) and the *Baseline Human Health Risk Assessment, Operable Unit V, Peconic River* (BNL, 2003). The *Operable Unit V (OU V) Peconic River Record of Decision (ROD)* (DOE, 2004) selected removal of sediment on BNL property (i.e., BNL Sewage Treatment Plant to the eastern BNL boundary) and outside BNL property (i.e., eastern BNL boundary to Schultz Road and some removal upstream and downstream of Manor Road) to levels that reduce contaminants in the ecosystem, are protective of human health, and provide the best balance of contamination removal versus impact to upland and wetland areas.

The DOE does not envision any sale or transfer of the BNL property in the Peconic River area. If it were to occur, the sale or transfer of BNL property would meet the requirements of Section 120(h) of CERCLA, as amended, Title 42 U.S. Code, Sec. 9620 to ensure that future users are not exposed to unacceptable levels of contamination.

1.3 Site Cleanup Criteria

The sediment in the Peconic River contained elevated levels of mercury, silver, and copper. The presence of the polychlorinated biphenyl (PCB) aroclor-1254 and radionuclides in the Peconic River sediment were also detected. It was determined that heavy metals, PCBs, and radionuclides would also be removed during removal of the mercury-contaminated sediment.

Mercury was selected as the contaminant of greatest concern for which cleanup levels for the sediment were established. This contaminant has been shown to bio-accumulate in fish and create a potential human health risk.

The detailed operational objectives to meet the mercury cleanup goals include:

- On Laboratory property, the response actions selected in the action memorandum for removal of sediment on BNL property will constitute the final action for this stretch of the Peconic River. The *Action Memorandum* states that sediment will be removed from designated depositional areas. The goal is to remove sediment in these areas such that average mercury concentrations in the Peconic River sediment on Laboratory property will be reduced to less than 1 ppm, and all mercury concentrations in the remediated areas are less than 2 parts per million (ppm) following the cleanup.

- Outside BNL property and upstream of Schultz Road, sediment would be removed from the ponded areas where methylation leading to bioaccumulation is most likely to occur, as well as other areas containing higher levels of contamination. The action memorandum for sediment removal outside BNL property states that the goal is to remove sediment in these areas such that average mercury concentrations in the Peconic River sediment in this section of the River (i.e., from the Laboratory boundary to Schultz Road) will be reduced to less than 0.75 ppm, and all mercury concentrations in the remediated areas are less than 2 ppm following the cleanup.

- Outside BNL property and east of Schultz Road (i.e., immediately upstream and downstream of Manor Road), sediment will be removed from designated depositional areas. The action memorandum for sediment removal outside BNL property states that the goal is to remove sediment in these areas such that all mercury concentrations in the remediated areas are less than 2 ppm following the cleanup.

The *OU V Peconic River ROD* stated that achieving these goals would provide significant mass removal of contaminants focused on protecting human health and the environment, the ecosystem, and reducing the bioaccumulation of mercury and PCBs in fish. It was estimated that approximately 92 percent of the mass of mercury in the surface sediment would be removed from the area from the STP to Schultz Road. Additionally, it would be expected that 93 percent of the mass of PCBs (measured as aroclor-1254) would be removed from the sediment as well as 91 percent of the mass of cesium-137.

1.4 Historic Data Summary

Some past operations and practices at BNL resulted in wastewater containing chemical and radiological contaminants being discharged to the Sewage Treatment Plant (STP) and then discharged to the Peconic River. The discharges into the Peconic River and the contaminants adsorbed to the STP sand filter beds have been a source of contamination to the Peconic River sediment.

Radiologically and chemically contaminated sand and soil at the STP were excavated and disposed of at an appropriate off-laboratory disposal facility in compliance with the January 2002 Operable Unit V STP Record of Decision. In addition, DOE has upgraded the STP and implemented programs to further reduce the discharge of contaminants to the Peconic.

The Peconic River between BNL and the town of Riverhead, approximately 15 miles downstream of BNL, has been characterized in several investigations reported in the *Operable Unit V Remedial Investigation Report* (IT Corporation, 1998) and the *Plutonium Contamination Characterization and Radiological Dose and Risk Assessment Report* (IT Corporation, 2000). The main purposes of the *Remedial Investigation* (IT Corporation, 1998) were to determine the nature, magnitude, and extent of soil, sediment, groundwater, and surface water contamination from the AOCs included in Operable Unit V, and to characterize the potential health risks and environmental impacts of contaminants present. The investigation included: geophysical and biological surveys, sampling of soil, groundwater, surface water, sediment and sewer pipes; chemical and radiological analyses; benthic invertebrate toxicity testing; fish bioaccumulation studies; and data validation. The contaminants analyzed for in the Remedial Investigation were metals, pesticides, polychlorinated biphenyls (PCBs), volatile organic compounds, semi-volatile organic compounds, and many radionuclides. The *Plutonium Report* (IT Corporation, 2000) further characterized the extent of radiological contamination, particularly for plutonium, in the Peconic River's sediment, surface water, groundwater, soil, and fish; and other AOCs in OU V. A supplemental sediment-sampling program was conducted in years 2001, 2002, 2003 and 2004 to provide additional information on the distribution of contaminants on and outside the BNL property. Those investigations indicated that several sections of the river, on Laboratory property between the BNL Sewage Treatment Plant (STP) and the BNL boundary, and outside Laboratory property in the Suffolk County parkland between the eastern BNL boundary and the Manor Road area, contained sediment with elevated concentrations of metals and/or radionuclides. These investigations also indicated that the highest concentrations of mercury in the sediment and methylmercury in the water column tended to occur in the ponded depositional areas. The depositional areas in the Peconic River are areas where the river dynamics tend to encourage the collection of sediment. Areas where this was observed included river bends, areas where the river abruptly widened, or where there was a significant change in water depth.

The following chronology details the significant events associated with OUV Peconic River:

Date	Event
January 20, 2004	Action Memorandum Peconic River Removal Action for Sediment on BNL Property Approved (Revised November 8, 2004)
May 10, 2004	Commenced on BNL Property Removal Action
September 2, 2004	Action Memorandum Peconic River Removal Action for Sediment off BNL Property Approved
September 15, 2004	Completed on BNL Property Removal Action
September 20, 2004	Commenced off BNL Property Removal Action
January 24, 2005	Final Operable Unit V Record of Decision for Area of Concern 30 (Peconic River) Approved
May 6, 2005	Off BNL Property Removal Action and OUV Peconic River Remedial Action Completed

1.4.1 Identification of Contamination

Classification of the nature and extent of soil and groundwater contamination was based on screening criteria for chemicals and radiological constituents in various media. The specific screening criteria used for the BNL OU V study area are detailed in section 4.2 of the *Remedial Investigation Report* (IT Corporation, 1998). Whenever possible, established regulatory criteria known as "chemical-specific Applicable or Relevant and Appropriate Requirements" (ARARs) were used to screen the analytical data. ARARs were used as screening criteria for groundwater because State and/or Federal drinking-water standards exist for many chemicals. In the absence of ARARs, non-enforceable regulatory guidance values, known as "to be considered" criteria, or "TBCs" were used to screen the data. This was the case for soil, which has no established State or Federal ARARs. Radionuclides for which there are no individual ARAR or TBC concentrations were screened against site-specific levels calculated using a risk model (RESRAD, ANL, 1993) that allowed a dose limit of 15 millirem per year above background. Screening criteria for sediment were selected as the higher of site background levels or the most stringent sediment screening criteria available (e.g., NYSDEC sediment screening criteria, Long and McDonald (1995) screening criteria).

A more recent investigation that characterized radionuclides in soil, sediment, surface water, fish, and groundwater in OU V and the Peconic River included, for comparison, samples of

surface water and sediment from a reference location (Connetquot River) and groundwater from wells located 18 to 30 miles west of BNL.

Based on community and regulatory input received during the spring 2000 public comment period for the PRAP, additional sediment sampling was undertaken to better delineate the extent of contamination in the sediment on the Laboratory property and outside the Laboratory property upstream of Schultz Road. Additional fish tissue sampling was also conducted to determine edible fish tissue concentrations in areas outside of the Laboratory property and included areas of the Peconic River that were previously dry during some of the prior sampling events.

State and Federal standards, criteria, and guidance were reviewed to evaluate the nature and extent of contamination in soil, sediment, groundwater, and surface water. Screening criteria used to identify contamination were derived from these requirements. These screening criteria are given in the *Operable Unit V Remedial Investigation Report* (IT Corporation, 1998) and *Risk Assessment Report* (IT Corporation, 2000).

Peconic River Sediment

Fourteen inorganic contaminants were detected at concentrations greater than the sediment-screening levels. Of these, the metals mercury (maximum 39.7 milligrams per kilogram [mg/kg]), silver (maximum 380 mg/kg), and copper (maximum 1490 mg/kg) were detected most often, and at the highest concentrations above the screening levels. Another analyte of concern on BNL property was the PCB aroclor-1254 (maximum 1.5 mg/kg). Contamination was highest in surface sediment and was most prominent in depositional areas approximately 0.5 mile, 1 mile and 1.5 miles downstream of the STP.

The presence of radionuclides in Peconic River sediment was also assessed. It was determined that radionuclides were present at levels that are below those requiring cleanup. Although the radionuclides are at levels not requiring cleanup, a large percentage will be removed with the other contaminants. Cesium-137, americium-241, and plutonium-239/240 are present at higher concentrations in the sediment for sections of the Peconic River upstream of Schultz Road than in the Connetquot River, a river with similar characteristics that is outside the influence of the BNL site. The Connetquot River was chosen to establish the background concentrations from natural and atmospheric pollution sources. The maximum cesium-137 concentration in sediment on Laboratory property was 44.1 picoCuries per gram (pCi/g). The maximum americium-241 and plutonium-239/240 concentrations were also found on the Laboratory property at 1.91 pCi/g and 0.158 pCi/g, respectively. Similar to the inorganic contaminants, the low-level radionuclides detected were highest in the surface sediment and were most prominent in the depositional areas.

Peconic River Fish

Fish collected from the Peconic River headwaters had bioaccumulated mercury and PCBs. The average concentrations measured in edible fish tissue samples off of the Laboratory property were 0.62 mg/kg mercury and 0.023 mg/kg aroclor-1254. Fish on the Laboratory property were analyzed as whole body samples (skin, bones, head, and internal organs were included). The average concentrations in these samples were 0.68 mg/kg mercury and 1.77 mg/kg aroclor-1254. The radionuclide cesium-137 was also detected frequently in fish. It was found in higher concentrations in fish collected on the Laboratory property, and generally in slightly higher concentrations in the flesh and skin than in the bone and entrails. The highest activity of cesium-137 in fish was in a whole-body sample of pickerel taken on the Laboratory property (2.7 pCi/g). Naturally occurring uranium radionuclides were also detected in some of the fish samples, with highest activities in the inedible portions of fish.

2.0 REMEDIATION ACTIVITIES

2.1 Work Locations

The Peconic River Remediation Project was divided into two phases to address on BNL property (Phase 1) and off BNL property (Phase 2) remediation activities. The Phase 1 remedial activity areas include the portion of the Peconic River from the BNL Sewage Treatment Plant to the eastern BNL property line (Areas A, B, C, and on-site portion of Area D). The Phase 2 Remedial Activity Areas include the portion of the Peconic River from the eastern BNL property line to Schultz Road (off-site portion of Area D, and portions of Areas E and P), as well as a portion of the River just upstream and downstream of Manor Road. Figures 2-1 and 2-2 illustrate the locations of the Phase 1 and Phase 2 remedial activities areas.

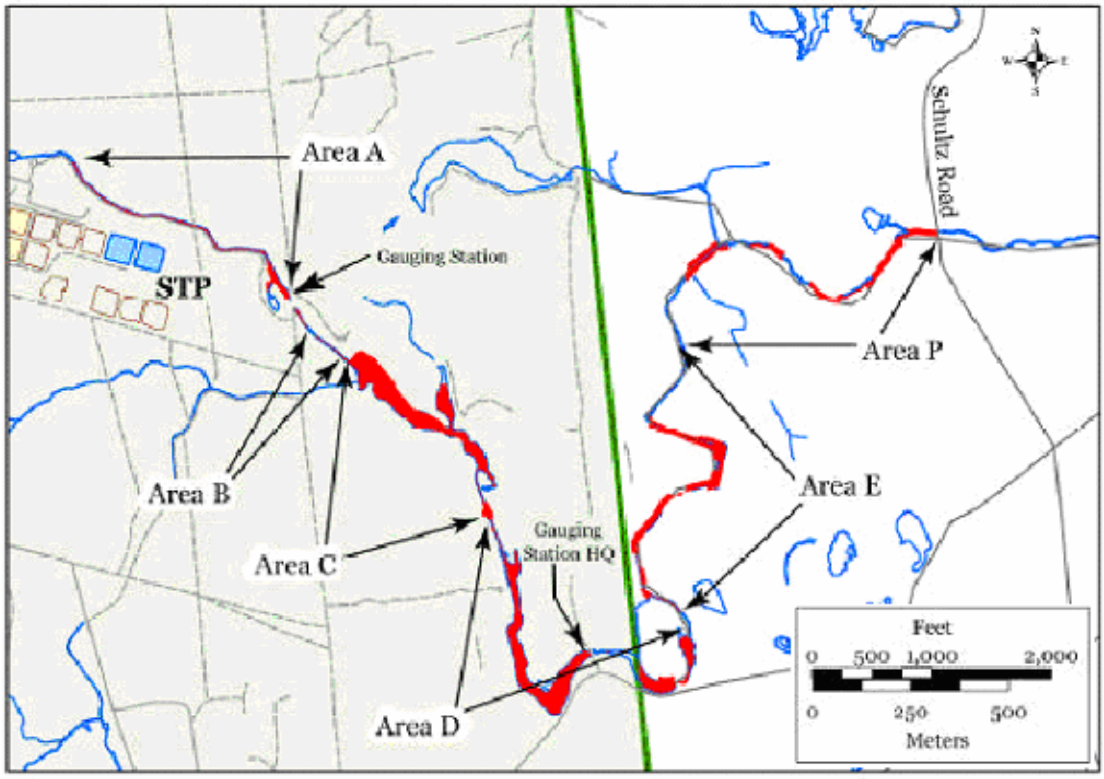

Figure 2-1: Phase 1 Sediment Excavation Area – BNL STP to BNL Property Line and Phase 2 Sediment Excavation Area – BNL property to Schultz Road

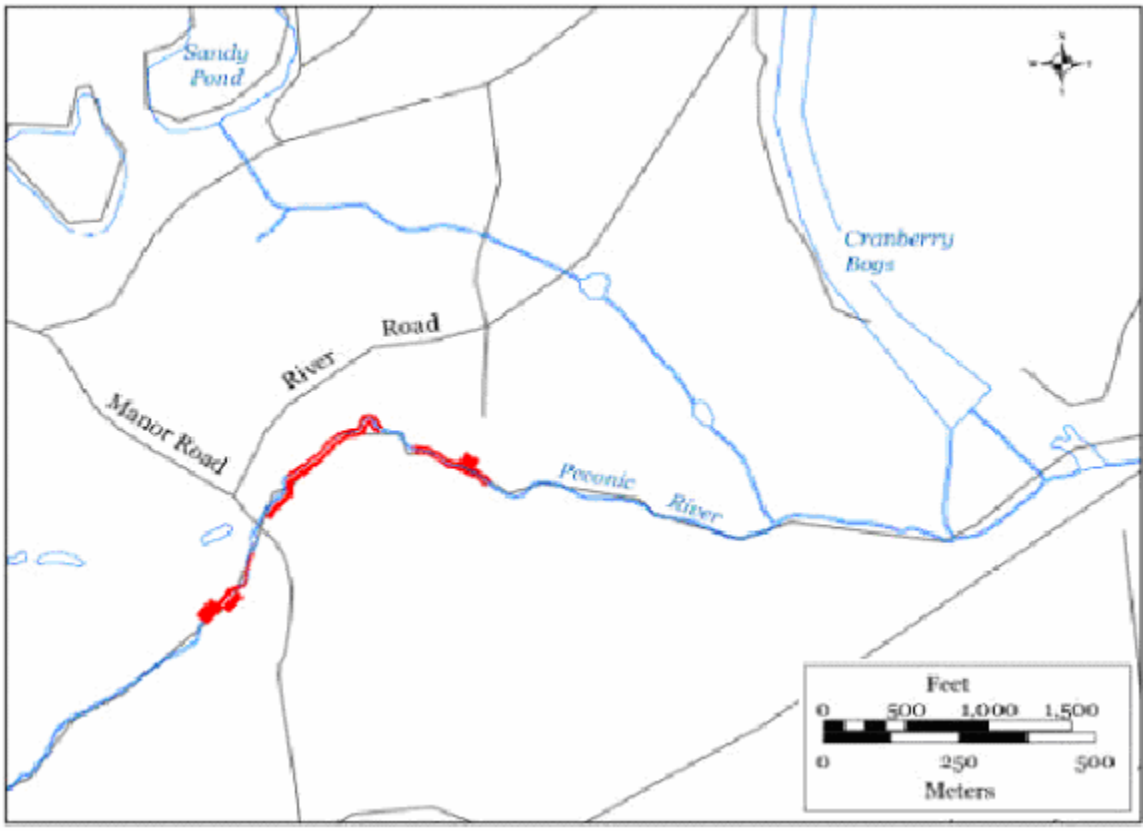

Figure 2-2: Phase 2 Sediment Excavation Area – Manor Road

2.2 Site Preparation

Temporary Access Path Installation

Temporary composite mats were used to provide access to the remediation areas while minimizing the environmental impact. The temporary access paths were made up of interlocking high-density polyethylene (HDPE) mats, each approx. 8-ft by 14-ft wide. The mat paths were placed over the existing ground surface and required no grubbing. Because of the relatively small width of the mats, installation required minimal clearing and tree removal.

Banded Sunfish Transfer

Sections of the Peconic River that were remediated contained the New York State threatened banded sunfish. Prior to excavation of the riverbed, banded sunfish and other aquatic species (other fish and turtles, etc.) were removed by BNL staff and transferred to a suitable habitat. The transfer of banded sunfish was performed in three phases.

The primary emphasis of the first phase was to capture as many of the banded sunfish as possible and to note the habitat type where they are most prevalent. The vegetation type was noted and later used to provide optimal habitat during the re-vegetation phase of the cleanup project. The most effective technique for collection had been demonstrated to be netting the fish with dip nets in areas of heavy vegetation such as smartweed. All of the collected banded sunfish were transferred to Zeke's Pond temporarily until being returned to the Peconic River. The Laboratory Natural Resource Manager has been monitoring the banded sunfish and he has reported that they have been thriving in Zeke's Pond. He will also evaluate the re-growth of cover vegetation in the Peconic River and make a recommendation as to when the banded sunfish can be safely returned to the river. Other fish and aquatic species incidentally collected during this period were transferred to suitable Peconic River habitat away from excavation activities.

The second phase of fish capture and relocation was conducted while the river was being dewatered. As the water level was lowered the fish were concentrated in the deeper sections of the river and BNL personnel collected additional banded sunfish and other fish that were not removed during the first phase of collections. The banded sunfish were transferred to Zeke's pond and other fish and aquatic species were transferred to suitable habitat downstream. The dewatering pumps were equipped with a ¼" screen to prevent fish from entering the pumps.

After all the areas have been re-vegetated, and suitable habitat has been determined to be present, the banded sunfish will be collected from the temporary storage location and returned to the Peconic River. It is anticipated that it will take approximately two years following the Peconic River restoration for the vegetation to reach sufficient density to provide suitable habitat for the banded sunfish.

Sediment Drying Pad

A sediment-drying pad (SDP) was constructed to serve as a central staging area for the excavated sediments, as well as a dewatering/drying location prior to load out and disposal. The SDP was installed adjacent to the railcar loading area at the former BNL "Glass Holes/Animal/Chemical Pits" yard. The SDP consisted of one large area measuring approximately 160' by 280'. The SDP was subdivided into separate cells/beds (i.e. Cells A, B, C and D), to better control waste verification analyses. The cells varied in size (from approx. 1000 cy to 2100 cy), based on sediment origination and consistency.

The perimeter of the drying pad was constructed with an earthen berm perimeter, and included three ramp entrances. The pad was lined with a 40-mil permalon liner and overlaid with a geocomposite drainage layer. The pad was sloped to drain from north to south with all free liquids directed to a lined sump in the southeast corner.

2.3 Water Management

Temporary Water Treatment

A temporary water collection system was located adjacent to the SDP to store and treat filtrate that was generated during the sediment drying operations. The system consisted of a 19,000-gallon weir/settling tank, a bag filter, and various 21,000-gallon holding tanks. The water was pumped from the sump into the weir tank. From there the water was pumped through a bag filter to remove suspended solids and deposited into holding tanks for sampling. Sampling and disposal is discussed in Section 3.3.

Headwater Bypass Pumping

Headwater bypass pumping was initiated to divert headwater flow away from the anticipated excavation areas downstream. Headwater bypassing was accomplished by installing a bladder dam downstream of the Sewage Treatment Plant (STP) outfall and before the beginning of the excavation area. This dam setup was intended to handle the flow from the Sewage Treatment Plant's outflow. In addition, a sandbag dam was installed just north of Gauging Station HE, approximately 110 feet upstream of the location where the STP effluent enters the Peconic River. This dam setup was used to control the upstream river flow. Both setups had float-activated 6-inch electric submersible pumps installed at their respective dams and manifolded to an 18-inch conveyance pipeline. Each pump is rated at approximately 1,000 gallons per minute at 100-foot of head loss. The water was pumped through the conveyance pipe from the bypass area to a discharge point near the BNL-Suffolk County property boundary downstream of the pilot study area. The discharge point had the final section of discharge pipe slotted to dissipate the outflow and emptied onto a large riprap stone apron.

Work Area Pumping

At each work area, water bladders or earthen dams were installed upstream and downstream of the excavation area to control water entering the active excavation area. The dams were used to control both upstream water and downstream backwash. Sumps were installed within the active excavation area to serve as low-point collection points for water from within the work zone. Four (4) inch dry-prime pumps were used to pump the water downstream to an area within the remediation area that had yet to be excavated or to a sediment filter bag downstream. During excavation, diversion trenches were also cut within the excavation to divert water away from active excavation areas.

2.4 Sediment Excavation

Excavation was achieved using one to two hydraulic excavators working from timber crane mats. The excavators were equipped with flat blade buckets and would excavate the sediments in a controlled manner to the required depth of approximately nine (9) inches. While excavating, the excavators would systematically pull material towards themselves and cast the material within reach of a "load out" excavator. The load-out excavator collected the sediment at the load-out area and loaded the material into off-road dump trucks. During Phase 1, a total of 12,988 cubic yards (CY) of sediment were removed. This included a backwater section in Area A and also the additional excavation of several areas to remove all sediment that had levels of mercury greater than or equal to 2 ppm. During Phase 2, a total of 8,200 cubic yards of sediment were removed. This included the three cleanup areas upstream and downstream of Manor Road to remove all sediment that had levels of mercury greater than or equal to 2 ppm.

After the sediments were loaded onto the dump trucks, the trucks delivered the sediment to the SDP. The off-road dump trucks carried between 4 CY to 18 CY per load, depending on the consistency and water content of the sediments. Approximately 2800 truckloads (1900 truckloads during Phase 1 and 900 truckloads during Phase 2) were moved from the excavation areas to the SDP.

2.5 Sediment Drying Operations

The sediment drying operation consisted of receiving excavated sediments from the river excavation areas and consolidating and drying the sediments on the lined SDP. The sediments were loaded into cells/beds for waste verification sampling and analysis. Cells varied in size (from approx. 1,000 cy to 2,100 cy), based on sediment origination and consistency.

As sediments were loaded into the cell, the material was routinely handled, mixed and aerated to promote drying and water release so that the sediments could pass the Paint Filter Test for moisture. In addition, both Dolomitic and High-Calcium Quicklime were used to enhance the drying time of the sediment by raising the temperature and hastening the evaporation of the water. The Quicklime was used at approximately .5% to 1.0% by weight of sediment. Approximately 88 tons of Quicklime was used during Phase 1 and an approximately 67 tons of quicklime were used during Phase 2.

As the material dewatered, the filtrate was collected in the sump on the pad and pumped to the temporary water treatment system for management.

2.6 Sediment Loading & Disposal

Rail cars were provided by ECDC Logistics, LLC for transportation of the sediments to the Pine Avenue/Niagara Falls Landfill in Niagara Falls, NY, a Subtitle D facility. After the rail cars arrived on site, they were inspected and released for loading. A "burrito bag" liner was placed within each railcar prior to loading. Approximately 80-100 tons of sediments were placed into each rail car. The weights of the sediment were determined utilizing a bucket scale on the front-end loader. After the sediments were loaded into the rail car, the liner was closed/secured using tie wraps and bungee hooks for transport and secured into position.

A total of 304 railcars were loaded, transported, and disposed during Phases 1 and 2, which equates to approximately 17,680 tons of material from Phase 1 areas (188 cars) and approximately 10,696 tons of material from Phase 2 areas (116 cars).

2.7 Site Restoration

2.7.1 Grading

Prior to planting and in accordance with the *Peconic River Restoration Program Phase 1 NYSDEC Permit Equivalency (Louis Berger, 2004)* and *Off-site Peconic River Restoration Program NYSDEC Permit Equivalency (Louis Berger, 2004)* the grade within the low marsh zone was restored to an elevation that will support wetland vegetation associated with low marsh habitats. The limits of the low marsh/open water areas were staked in the field and grade stakes were used to direct the re-grading work to the proper elevations.

River sediments were excavated from the open water/aquatic bed areas to restore grades within the proposed low marsh areas. The sediments also serve as a topsoil layer to support plant establishment and growth. Approximately six to 12 inches of material was excavated from the open water areas and placed within the low marsh areas. The sediment was placed and spread with an excavator.

The depth of sediment required to restore the correct low marsh elevations was determined through the use of bio-benchmarks. Bio-benchmarks are reference elevations acquired from existing low marsh features that represent a range in physical changes associated with the plant community. Examples would include the top and bottom of tussock sedge, the rooting elevation of cattails, the elevation at which there is no plant growth, and the elevation where woody plants (shrubs and trees) begin. Numerous points for each feature were acquired from different locations and compared to determine the bio-benchmark elevation for the restored low marsh areas. The bio-benchmarks were established at intervals of approximately 1,000 feet to capture elevation changes within the low marsh zone.

2.7.2 Channel Restoration

The channel within portions of the open water/aquatic bed areas was restored to approximate the low flow channel that existed prior to remediation activities. The channel was restored through the excavation of a ten-foot wide channel to match the existing channel widths. The depth of excavation varied between one to two feet. The channel was established to maintain a down gradient flow path.

2.7.3 Seeding

Following acceptance of the grading of the planting surface, the low marsh planting zone was seeded and the seed incorporated into the soil. The seeding operation extended 10-feet outside of the limit of the disturbed wetland area. The seed mix was composed of three species (*Agrostis alba, Lolium multiflorum and Echinocloa crus-gali*) that will provide for short-term cover to prevent erosion, but will not persist within the plant community beyond the first or second growing season. The short-term cover seeds chosen are not very competitive and will be overtaken by the native plant community.

2.7.4 Plant Material

The reuse of plant material from the remediation areas (transplants) was maximized to the extent practicable for planting the low marsh and aquatic bed areas. Additional plant material was cautiously gathered from within adjoining wetlands to fulfill planting requirements. The plants from outside of the remediation areas were collected at a minimum of five feet apart, and areas with dense stands of reed canary grass, common reed (*Phragmites*) or other invasive species were avoided. A total of approximately 28,117 plants were collected for transplanting on BNL property between June and September of 2004. Table 1 provides an estimate of the number of plants collected by species.

Table 1: Plant species and estimated number collected to plant Restoration Areas A, B, C, and D.

Scientific Name	Common name	Number collected
Sparganium americanum	Burreed	17379
Carex stricta	Tussock sedge	2362
Carex lurida	Shallow sedge	14
Carex sp.	Sedge	65
Typha latifolia	Cattail	127
Polygonum amphibium	Swamp smartweed	1235
Polygonum hydropiper	Water pepper	1298
Scirpus cyperinus	woolgrass	745

Callitriche	Water starwort	50
Eleocharis palustris	Common spike rush	475
Juncus effusus	Soft rush	232
Decodon verticillatus	Swamp loosestrife	731
Scirpus validus	Soft-stem Bulrush	70
Leersia oryzoides	Rice cut grass	3334
TOTAL		28117

Approximately 18,917 native plants were gathered from remediation areas off of BNL property to fulfill planting anticipated requirements. Most of the plant collection effort occurred in October 2004. A complete listing of species collected can be found in Table 2.

Table 2: Plant species and estimated number collected to plant Restoration Areas D, E, P, and Manor Road.

Scientific Name	Common name	Number collected
Sparganium americanum	Burreed	14,350
Carex stricta	Tussock sedge	2208
Carex lurida	Shallow sedge	35
Typha latifolia	Cattail	1847
Scirpus cyperinus	Wool grass	167
Scirpus atrovirens	Green bulrush	2
Eleocharis palustris	Common spike rush	85
Juncus effusus	Soft rush	84
Decodon verticillatus	swamp loosestrife	87
Peltandra virginica	Arrow arum	27
Scirpus validus	Soft-stem Bulrush	10
Calamagrostis canadensis	Bluejoint	15
TOTAL		18,917

The root systems of each transplant collected from within the remediation areas was thoroughly washed of sediments on-site prior to transport out of the collection site. The transplants were placed in containers with a sand substrate for transport to a shaded holding area until needed for planting.

The transplants were installed on 3-foot centers within the low marsh areas. The low marsh zone was planted with a mixture of herbaceous plants commonly occurring within the existing wetland community. These species include *Polygonum* spp., *Carex stricta, Carex sp., Carex lurida, Scirpus validus, Juncus effusus, Sparganium americanum, Decodon verticillatus, Glyceria, Leersia, Typha,* and *Eleocharis obtusa* and *Eleocharis palustris*.

Sparganium and *Callitriche* were the only native plants that could be harvested for transplanting into open-water areas, especially along and within the stream channel margin. These species are included to provide an aquatic bed that will be beneficial to existing fish populations. These species were established where the water depths would not exceed 18 inches. A planting spacing of 30 feet on center was used with three to five plants installed at each location.

Phragmites control - In August, 2004 members of the wetland plant restoration team noticed widespread sprouting of *Phragmites australis* (common reed) from rhizomes that remained after the contaminated sediment was removed. *Phragmites* is an aggressive invasive grass that frequently grows in moist upland and wetland soils. Dense stands of Phragmites frequently out-compete native wetland plants and are exceptionally successful at colonizing disturbed soils. BNL evaluated methods to eliminate/minimize their impacts by removing them and determined that the most successful method would be applying the herbicide Glypro directly to their leaves and sprouts ("wicking") with a sponge-covered applicator. BNL applied for and received authorization to apply the herbicide via an Article 15/Part 329 Aquatic Pesticide Permit. On October 13, 2004 a New York State registered and certified pesticide applicator (Allied Biological, Inc.) treated approximately 2 acres of the remediated banks of the Peconic River on BNL property.

2.7.5 Summary of Restored Areas – Phase 1

Planting was performed on BNL property in Areas A, C and D. Area B is an open water channel with no low marsh components requiring replanting. The estimated acreage of wetland restoration for each area is summarized in Table 3.

Table 3: Acreage of Wetland Restoration – Phase 1

On-Site Area	Open Water (acres)	Low Marsh (acres)	Total (acres)
A	1.10	0.10	1.20
B	0.15	-	0.15
C	2.74	3.10	5.84
D	2.15	2.10	4.25
TOTAL	6.01	5.30	11.44

Note: Area C includes low marsh and open water areas previously associated with Area B

The estimated numbers of plants installed on BNL property, by species and by planting area, are presented in Table 4. The difference between the number of collected plants and those that were planted in either phase of the project is due to the survival rate of the collected material while in storage and transport. A percentage of plant material died in storage that had to be replaced

during the planting phase. This additional material collection is reflected in the total number of plants collected, thus making this number higher than what was planted. The total number of plants installed is approximately 25,463 plants.

Table 4: Summary of the Estimated Number of Plants by Species Installed in each On-site Restoration Area

Scientific Name	Area A	Area B	Area C	Area D	Total planted
Sparganium americanum	525		7894	6331	14750
Carex stricta	75		1208	1069	2362
Carex lurida				14	14
Carex sp.				65	64
Typha latifolia			100	27	127
Polygonum amphibium			900	335	1235
Polygonum hydropiper			1148	150	1298
Scirpus cyperinus			30	700	730
Callitriche	50				50
Eleocharis palustris			200	275	475
Juncus effusus			155	67	222
Decodon verticillatus			364	367	731
Scirpus validus				70	70
Leersia oryzoides			2149	1185	3334
TOTAL	650	0	14175	10628	25463

2.7.6 Summary of Restored Areas – Phase 2 including Manor Road

Planting was performed off BNL property in Areas D, E, and P and in the vicinity of Manor Road. The estimated acreage of wetland restoration for each area is summarized in Table 5.

Table 5: Acreage of Wetland Restoration – Phase 2

Off-Site Area	Open Water (acres)	Low Marsh (acres)	Total (acres)
D	0.90	0.79	1.69
E	1.36	1.41	2.77
P	0.01	1.86	1.87
Manor Rd.	1.44	0.96	2.40
TOTAL	3.71	5.02	8.73

The estimated numbers of plants installed off BNL property, by species and by planting area, are presented in Table 6. The total number of plants installed is approximately 17,322 plants.

Table 6: Summary of the Estimated Number of Plants by Species Installed in each Off-site Restoration Area

Scientific Name	Area D	Area E	Area P	Manor Road	Total planted
Sparganium americanum	2531	4138	2668	2475	11812
Carex stricta	1375	395	540	308	2618
Carex lurida		5	30		35

Scirpus validus		10			10
Calamagrostis canadensis		15			15
TOTAL	4060	7151	3238	3083	17,322

2.7.7 Restoration of Temporary Mat Roads

Following completion of sediment removal from the river, all temporary dams and all piping, pumps, straw, and mats were removed and/or restored as appropriate. Wood chips were dispersed along the former mat roads. Because grubbing had been avoided and roots and brush had been left in place, Phase 2 mat recovery was as successful as during Phase 1. The on-site bluestone haul road was removed on July 29, 2005. The entrances to the haul road were blocked with fallen trees and brush to prevent vehicle traffic.

Two additional steps have been undertaken to discourage all-terrain vehicle (ATV) access to the former mat roads on Suffolk County Parkland property. First, the beginning of each of the seven former mat roads that enter Suffolk County property from Z Path (4), Wading River Manor Road (1) or River Road (2) were densely planted with trees and brush to visually and physically obscure the entrance to ATV use. In addition, cut brush and trees were placed across the paths to further discourage their use by ATVs.

3.0 WASTE MANAGEMENT

3.1 Waste Characterization and Handling

The waste management strategy, waste characterization, packaging, handling, and storage were performed in accordance with the *BNL Waste Management Plan, Peconic River Remediation Project, On-Site – Phase 1* (Envirocon, 2004c), the *BNL Waste Management Plan, Peconic River Remediation Project, Off-Site – Phase 2* (Envirocon, 2004d), and the *BNL Standards Based Management System* (SBMS). The excavated sediments were staged in drying cells adjacent to the rail line in the south section of the BNL property prior to loading into railcars for shipment to the Pine Avenue/Niagara Falls Landfill in Niagara Falls, NY for final disposal.

Waste verification sampling for sediment disposal was performed, in accordance with the Waste Acceptance Criteria of the Pine Avenue/Niagara Falls Landfill, on each completed cell of the SDP. Full radiological (gross alpha/beta, gamma spec, Plutonium 238,239/240, Tritium, and Uranium 233/234,235,238), TCLP (volatiles, semi-volatiles, metals, herbicides and pesticides per SW-846), and PCB analysis were required for each 300 CY of sediment to be shipped.

In addition to collecting a sample for each 300 CY, BNL also collected a sample for every 70 CY and performed gamma spectroscopy In-Situ Object Counting System (ISOCS) and beta scintillation analyses to ensure that the radioactivity in the waste was at or near background and in compliance with the Department of Energy Authorized Release Limits shown in Table 7 below. These samples were analyzed on-site.

Table 7: Authorized Release Limits for Radionuclides

Parameter	Release Criteria (pCi/g)
^{241}Am	3
^{137}Cs	10
^{60}Co	2
^{238}Pu	1
$^{239/240}Pu$	1
^{90}Sr	5

No sample result from the Phase 1 or Phase 2 remediation exceeded the radiological Authorized Release Limits or hazardous levels. Attachments A (Phase 1), B (Phase 2, including Manor Road) contain the results of the TCLP, PCB, and radiological verification samples.

As part of waste approval, the sediments on the SDP were tested onsite to ensure the material passed the Paint Filter Liquids Test. The analytical frequency for paint filter tests was one sample for approximately each 100 CY of sediment. The testing was performed as per EPA SW-846 Method 9095A. Envirocon performed 145 paint filter tests for Phase 1, and 75 paint filter tests for Phase 2. The paint filter test reports are provided in Attachment C.

3.2 Waste Shipment and Disposal

The transportation carrier, ECDC, shipped the sediment to the Pine Avenue/Niagara Falls Landfill by rail for final disposal. As described in Section 2.6, sediment was placed into "burrito bag" liners within the rail cars and then closed and tied down. Waste loading and shipping for Phase 1 was initiated on July 1, 2004 and was completed on September 14, 2004. Waste loading and shipping for Phase 2 commenced on February 8, 2005 and was completed on May 3, 2005. A total of 304 railcars were shipped to the Pine Avenue/Niagara Falls Landfill by rail for final disposal. The railcar shipment summaries are provided in Attachment D.

3.3 Water Collection System Disposal

Water samples were collected from the temporary water collection system located adjacent to the SDP. Each tank was sampled for a modified SPDES constituent list. This list includes pH (EPA 150.1), Total Suspended Solids (EPA 160.2), TAL Metals (SW6010/6020/7470), Gross alpha / beta (SW846 9310), and Gamma Spectroscopy (EPA 901.1). The analytical results are provided in Attachment E. As a rule, if the results for pH and Total Suspended Solids exceeded the limits, the additional analyses were not performed by the analytical laboratory. The water was then treated and re-sampled for full analysis.

Approximately 500,000 gallons of water was collected, sampled, and managed through the on-site water collection system. All water was filtered through bag filters to meet SPDES discharge limits and discharged into the BNL Sewage Treatment Plant.

3.4 Pollution Prevention and Waste Minimization Opportunities

The overall objectives of the BNL Pollution Prevention and Waste Minimization Program include the following:

- Reduction of environmental impacts as low as reasonably achievable;
- Elimination or reduction of wastes, effluents, and emissions;
- Reduction of waste management costs;

- Conservation of natural resources and reuse of materials; and,
- Recycling and procurement of environmentally preferable products.

The pollution prevention and waste minimization opportunities that resulted in cost avoidances during the Peconic River remediation include the following:

- Trees and shrubs that were cleared for access road installation were chipped where possible and reused as mulch. Other trees and shrubs were used to create brush piles on the access roads to prohibit use by ATVs. Some downed trees were also used to create snags and habitat in the river and marsh.
- The use of the composite mats for the access roads eliminated the need to grub or excessively clear trees. This reduced the amount of trees to remove and eliminated the disposal of any grubbed material.
- Many wetland plants were removed prior to remediation and reused during restoration. The plants that were harvested from the excavation areas had their root systems thoroughly washed of sediments prior to being stored and subsequently replanted.
- The collected water from the SDP was sampled, analyzed, and treated to meet SPDES discharge limits so that it could be discharged at the BNL Sewage Treatment Plant. This eliminated the need for off-site disposal of the water.

During remedial operations, the following notable "releases" were encountered:

1. Diesel spilled from a non-operating pump caused by heat expansion of fuel tank.
2. A hydraulic line broke on excavator boom caused by snagging on tree limb.
3. A hydraulic hose fitting loosened on off-road dump truck spilling hydraulic fluid.
4. An engine oil leak on fuel delivery truck spilling oil on dirt road.

The impacted soils and sediments were immediately remediated and the total affected volume was minimal. The corrective actions that were employed to remedy these releases and to prevent future releases included the following:

- All pumps and generators were placed within secondary containment;
- All containment areas inspected daily;
- All equipment inspected prior to use;
- Spill cleanup/containment kits placed in or with all equipment;
- Spill containment bins used during all fueling operations; and,
- Conventional hydraulic oil replaced with environmentally friendly peanut oil in some equipment.

4.0 FINAL INSPECTION AND CERTIFICATIONS

4.1 Pre Excavation Survey – Phase 1 and Phase 2

Prior to excavation activities, the BNL land surveyor (Municipal Land Survey, P.C.) performed a pre-excavation survey to establish baseline elevation data for the creation of a 700 square foot (SF) sampling grid system. The sampling grid was performed by Envirocon's NY State certified Land Surveyor Kenneth Beckman, LS. Subdividing the surveyed areas into 700 SF sampling grids resulted in 788 sampling points for Phase 1 and 1591 sampling points for Phase 2, each of which had a confirmatory sample collected and analyzed.

4.2 Post Excavation Confirmation Samples

Sample locations for confirmation sampling were taken at each 700 SF sampling grid established by Kenneth Beckman, LS. To provide confirmation that areas that exceeded the cleanup level had not been missed, the sampling grids included both the wetland areas designated to be remediated and not designated to be remediated. In accordance with the *Sampling & Analysis Plan* (Envirocon, 2005a), one confirmatory grab sample was taken from the approximate center of each sampling area and analyzed for total mercury. In addition, 10% of the samples within the excavation areas were randomly selected and analyzed for silver, copper, PCBs, and radionuclides, silver and copper.

4.2.1 Phase 1

A comparison of the pre-excavation average concentrations for mercury, silver, copper, PCBs, and cesium-137 to the post-excavation average concentrations in Phase 1 areas on BNL property is summarized in Table 8.

Table 8: Summary of Final Contaminant Concentrations – Phase 1

Analyte	Pre-excavation Average Concentration	Final Average Concentration	Percent Reduction in Concentration
Mercury	4.6 mg/kg	0.2 mg/kg	96%
Silver	61.8 mg/kg	2.2 mg/kg	96%
Copper	310.9 mg/kg	10.5 mg/kg	97%
PCBs (1)	0.133 mg/kg	0.0015 mg/kg	99%
Cs-137	5.7 pCi/g	0.7 pCi/g	88%

Thirty-four samples, including several from outside the designated excavation areas, initially came in greater than 2 ppm for mercury. Upon receipt of the analytical data, BNL and its subcontractor visually inspected the grid to determine the most appropriate method of removing the residual mercury contamination. Based on the inspection and the location of the grid BNL instructed the contractor in the method and means to excavate additional material. All of these areas were determined to be accessible and were further excavated to lower the mercury level remaining in the sediment to less than 2 ppm.

Table 9 identifies the post-excavation confirmatory samples and lists the 34 sample values (of the 788 sampling points) that did not initially meet the less than 2 ppm goal for mercury (*Initial Post-excavation Results*). Each of these sample locations were re-excavated and re-sampled (*Final Post-excavation results*). The final results for all 34 samples were substantially less than 2 ppm of mercury. The analytical results for the on-site Phase 1 confirmatory samples are provided in Attachment F.

Table 9: Phase 1 Confirmation Samples Originally Greater than or Equal to 2 ppm and Final Post-Excavation Confirmation Sample Results

19291-016	600	08/21/04	Area D	08/27/04	**3.9**	0.060

[+]Sample #480 was re-excavated and re-sampled twice prior to achieving a final result (0.036) less than the 2 ppm goal.

4.2.2 Phase 2

A comparison of the pre-excavation average concentrations for mercury, silver, copper, PCBs, and cesium-137 to the post-excavation average concentrations in Phase 2 areas off of BNL property, excluding the Manor Road area, is summarized in Table 10.

Table 10: Summary of Final Contaminant Concentrations – Phase 2

Analyte	Pre-excavation Average Concentration	Final Average Concentration	Percent Reduction in Concentration
Mercury	1.79 mg/kg	0.092 mg/kg	95%
Silver	35 mg/kg	0.94 mg/kg	97%
Copper	142 mg/kg	3.19 mg/kg	98%
PCBs [(1)]	0.048 mg/kg	0.040 mg/kg	16%
Cs-137	5.4 pCi/g	0.294 pCi/g	95%

Eight samples, including several from outside the designated excavation areas, initially came in greater than 2 ppm for mercury. Upon receipt of the analytical data, BNL and its subcontractor visually inspected the grid to determine the most appropriate method of removing the residual mercury contamination. Based on the inspection and the location of the grid BNL instructed the contractor in the method and means to excavate additional material. All of these areas were determined to be accessible and were further excavated to lower the mercury level remaining in the sediment to less than 2 ppm.

Table 11 identifies the post-excavation confirmatory samples and lists the eight sample values (of the 1442 sampling points) that did not initially meet the less than 2 ppm goal for mercury (*Initial Post-excavation Results*). Each of these sample locations were re-excavated and re-sampled (*Final Post-excavation results*). The final results for all eight samples were substantially less than the 2 ppm goal for mercury. The analytical results for the Phase 2 confirmatory samples, excluding Manor Road, are provided in Attachment G.

Table 11: Phase 2 Confirmation Samples Originally Greater than or Equal to 2 ppm and Final Post-Excavation Confirmation Sample Results

* Sample #372 was re-excavated and re-sampled two times prior to achieving a final result (0.024)

4.2.3 Manor Road

A comparison of the pre-excavation average concentrations for mercury, silver, copper, PCBs, and cesium-137 to the post-excavation average concentrations in the areas upstream and downstream of Manor Road is summarized in Table 12.

Table 12: Summary of Final Contaminant Concentrations – Manor Road

Analyte	Pre-excavation Average Concentration	Final Average Concentration	Percent Reduction in Concentration
Mercury	1.08 mg/kg	0.185 mg/kg	83%
Silver	9.48 mg/kg	1.75 mg/kg	82%
Copper	44.95 mg/kg	0.48 mg/kg	99%
PCBs (1)	Not sampled	0.058 mg/kg	Not applicable
Cs-137	2.88 pCi/g	0.150 pCi/g	95%

Four samples initially came in greater than 2 ppm for mercury. Upon receipt of the analytical data, BNL and its subcontractor visually inspected the grid to determine the most appropriate

method of removing the residual mercury contamination. Based on the inspection and the location of the grid BNL instructed the contractor in the method and means to excavate additional material. All of these areas were determined to be accessible and were further excavated to lower the mercury level remaining in the sediment to less than 2 ppm.

Table 13 identifies the post-excavation confirmatory samples and lists the four sample values (of the 149 sampling points) that did not initially meet the less than 2 ppm goal for mercury (*Initial Post-excavation Results*). Each of these sample locations were re-excavated and re-sampled (*Final Post-excavation results*). The final results for all four samples were substantially less than the 2 ppm goal for mercury. The confirmatory sample analytical results for the areas upstream and downstream of Manor Road are provided in Attachment H.

Table 13: Manor Road Confirmation Samples Originally Greater than or Equal to 2 ppm and Final Post-Excavation Confirmation Sample Results

ID #	*Sample #*	*Orig Date Taken*	*Sample location*	*Re-sample Taken*	*Initial Post-Excavation Results Greater Than or equal to 2 ppm (mg/kg)*	*Final Post-excavation Results (mg/kg)*

4.3 Conclusions of Post Excavation Confirmation Samples

The following Remedial Action Objectives for Phase 1 have been achieved on BNL property by the remediation of the section of the Peconic River within the BNL boundaries.

1) Reduce site-related contaminants (e.g., mercury) in sediment to levels protective of human health.
   a) The remediation has reduced the average mercury concentration on BNL property from 4.6 ppm to 0.2 ppm. Sediment concentrations of mercury have thus been reduced into the range of background concentration (and in some cases below background). Human health risks are expected to be similarly reduced and will be confirmed with long-term monitoring.

2) Reduce or mitigate, to the extent practicable, existing and potential adverse ecological effects of contaminants in the Peconic River.
   a) Ecological risks are expected to be reduced to background and monitoring of the ecological receptors will be performed as stipulated in the *OU V Peconic River ROD* and Long Term Monitoring plans to ensure the remedy's effectiveness.

3) Prevent, or reduce to the extent practicable, the migration of contaminants off the BNL facility to areas where risk may be unacceptable.
   a) Because Peconic River flow was diverted around the section of the river being excavated, the cleanup was done in a "dry" environment and the contaminants did not have an opportunity to become suspended and migrate off the laboratory property. Having achieved background concentrations of mercury and greatly reduced the concentrations of other collocated contaminants (silver, copper, and PCB's), BNL has substantially reduced the potential for other site related contaminants to migrate downstream.

The following Remedial Action Objectives for Phase 2 have been achieved outside of BNL property.

1) Protect human health through the reduction of BNL-related contaminants (e.g., mercury) in sediment.
   a) The remediation has reduced the average mercury concentration off of BNL property into the range of background levels (and in some cases below background). Sediment concentrations of mercury have thus been reduced into the range of background concentration (and in some cases below background). Human health risks are expected to be similarly reduced and will be confirmed with long-term monitoring that will include sediment, fish, and water column sampling

2) Reduce or mitigate to the extent practical, existing and potential adverse ecological effects of contaminants in the Peconic River.
   a) Ecological risks are expected to be reduced to background and monitoring of the ecological receptors will be performed as stipulated in the *OU V Peconic River ROD* and Long Term Monitoring plans to ensure the remedy's effectiveness.

3) Prevent or reduce, to the extent practicable, the migration of contaminants from locations outside BNL property to other areas where risk may be unacceptable.
   a) Because Peconic River flow was diverted around the section of the river being cleaned up, the cleanup was done in a "dry" environment contaminants did not have an opportunity to become suspended and migrate off the laboratory property. Having

achieved background concentrations of mercury and greatly reduced the concentrations of other contaminants, BNL has substantially reduced the potential for other site related contaminants to migrate downstream.

4.4 Worker Exposure to Mercury Assessment

Mercury air samples were collected during Phase 1 based on NIOSH Method 6009 using a filter cassette for collecting particulate material and an absorbent tube to collect mercury vapor. The samples were analyzed for elemental mercury and mercury salts. The results of these tests are in Attachment I. Sampling results detected only elemental mercury (vapor) in concentrations below the established exposure limits of OSHA (Occupational, Safety and Health Administration), ACGIH (American Conference of Governmental Industrial Hygienists) and the action levels established by Envirocon in the site-specific Health and Safety Plan (HASP).

In addition, a real-time air monitor (Jerome Mercury Vapor Analyzer) was used to test the material on the drying pad for any evolution of mercury vapor during Phase 1 storage and load-out operations. During this testing no mercury vapor was detected.

Monitor readings were taken at the face of the material on the drying pad, including material freshly exposed by the loader while material was being stockpiled. Testing was conducted during Phase 1 excavation prior to any load out activities load-out.

Since the analytical results of the mercury vapor monitoring were on the order of two magnitudes lower than the OSHA exposure limit for mercury, and the expected concentrations of mercury in the sediment are higher in the Phase 1 areas than the Phase 2 areas, mercury vapor monitoring was not conducted during Phase 2 activities.

Sampling for respirable and total dust was also conducted during Phase 1 tasks using NIOSH Methods 0500 and 0600. Testing primarily focused on haul truck operations and the operation of an open cab Bobcat on the unpaved perimeter roads at the site. These results are attached to this report. Based on the sampling results, exposure to truck drivers and equipment operators on the site do not exceed the established exposure limits of OSHA, ACGIH (American Conference of Governmental Industrial Hygienists) as well as the action levels established by Envirocon in the site-specific Health and Safety Plan (HASP). The samples were collected following the ACGIH guidelines and all the results are in Attachment I.

Since work activities during Phase 1 showed that analytical results for respirable and total dust were an order of magnitude lower than the OSHA exposure limits, air monitoring for respirable and total dust was not conducted during Phase 2 activities.

4.5 Adherence to Health and Safety Requirements

All work associated with the remediation of the Peconic River was performed in accordance with the project specific Health and Safety Plans that were part of the *Work Plan for Peconic River Remediation Project Phase 1 – On Site Areas* and the *Work Plan for Peconic River Remediation Project Phase 2 – Off Site Areas.* The Health and Safety Plan addressed all the hazards anticipated while remediating the Peconic River and detailed Activity Hazard Assessments (AHAs) were prepared to provide guidance to the workers. The AHAs were valuable tools used on a daily basis to address heat and cold stress, ticks, excavation safety, use of hand tools, hazards communication, spill prevention, railcar safety, and numerous other activities requiring specific management guidance. The project was safely completed due to the workers strict compliance with the Health and Safety Plan.

5.0 LONG TERM MONITORING

The Long Term Response Action Group will perform the Long Term Monitoring of the Peconic River. They will coordinate all sampling events, data evaluation, and regulatory communications. The specific point of contact will be Dr. Timothy Green at (631) 344-3091.

As per the Wetlands Equivalency Permits, BNL shall perform monitoring and maintenance of the restored areas of the Peconic River (AOC 30) for two growing seasons (2005 and 2006). A report shall be generated and submitted to the NYSDEC and Suffolk County Department of Parks to demonstrate compliance with the permit conditions. In addition to the two-year requirement, BNL will continue to monitor the restoration results for three more years. The monitoring results will be documented in the annual Site Environmental Reports.

5.1 Monitoring Duration

The ecological monitoring program will be implemented to demonstrate the effectiveness of the cleanup until, at a minimum; the first five-year review is completed. At the completion of that review, all data will be assessed to determine if further long-term monitoring is required. A reduction in the monitoring frequency will be requested if the ecological health for a remediated area is determined to be satisfactory at that time.

The sediment trap upstream of the Peconic River Area D Pilot Study shall remain in place until the on-site remediated areas are fully vegetated. At that time, DOE will submit a notification for approval of the removal of the sediment trap to the EPA and the NYSDEC.

5.2 Sampling

BNL will conduct annual sampling of the sediment, water column, and fish to monitor the success of the cleanup. The details of the maintenance and monitoring are included in the *Operable Unit I Soils and Operable Unit V Long-Term Monitoring and Maintenance Plan* (BNL, 2005). Specifically:

- Water column samples will be collected during June and August of each year at 21 locations between the BNL STP and Connecticut Avenue and analyzed for methyl mercury.
- Annual sediment samples will be collected at a total of 30 locations of the Peconic River and analyzed for mercury and PCBs.
- In collaboration with the NYSDEC Fisheries Division, BNL will maintain an ongoing program for collecting and analyzing fish from the Peconic River and surrounding freshwater bodies. Results of the fish sampling are documented in the *BNL Site Environmental Reports*.

The results of these three sampling evolutions will be assessed and a letter report will be generated for regulatory review.

6.0 PERFORMANCE STANDARDS AND CONSTRUCTION QUALITY CONTROL

All work associated with the remediation of the Peconic River was performed in accordance with the project specific Quality Assurance/Quality Control Plans that were part of the *Work Plan for Peconic River Remediation Project Phase 1 – On Site Areas* and the *Work Plan for Peconic River Remediation Project Phase 2 – Off Site Areas.* The Remedial Action at the on-site and off-site areas of the Peconic River successfully completed the objectives addressed in the *OU V Peconic River ROD* and stated in Section 1.1. Specifically, the levels of contamination in the river bottom were reduced to the prescribed concentrations addressed in the *Action Memorandums* (less than 2 ppm for mercury and an average of less than 1 ppm On-Site and an average of less than 0.75 ppm Off-Site). Based on 788 confirmation samples from On-Site excavation areas (Phase 1), the remediation has reduced average mercury concentrations by 96% from 4.6 ppm to a background concentration of 0.2 ppm. Data from 1,591 confirmation samples from Off-Site excavation areas (Phase 2, including Manor Road) indicates that the remediation has reduced average mercury concentrations to background concentrations. The final average mercury concentration for Phase 2 areas D, E, and P was 0.092 mg/kg, and the final average mercury concentration for the Phase 2 Manor Road area was 0.185 mg/kg.

In addition, average copper, PCBs, and cesium-137 concentrations in sediments on BNL property were reduced to background concentrations. Average copper, PCBs, and cesium-137 concentrations in sediments off BNL property were reduced to background concentrations as well. Also, silver concentrations were reduced an average of 96% on BNL property and 82% to 97% off of BNL property.

A total of 304 railcars were loaded, transported, and disposed during Phases 1 and 2, which equates to approximately 17,680 tons of material from Phase 1 areas (188 cars) and approximately 10,696 tons of material from Phase 2 areas (116 cars). The quantity of material cannot be quantified by specific area due to the intermingling of stockpiles during excavation and loading activities.

Ecological risks are expected to be reduced to background. Monitoring of the ecological receptors will be performed as stipulated in the *OU V Peconic River ROD* and Long Term Monitoring Plans to ensure the effectiveness of the Remedial Action.

Diverting the flow of the Peconic River around excavation areas allowed the work to be performed under "dry" conditions, thereby preventing contaminants from migrating to areas downriver. Achieving background concentrations of heavy metals, PCBs, and cesium-137 in the riverbed substantially reduced the potential for contaminants to migrate downriver.

7.0 LESSONS LEARNED

The following is a summary of the lessons learned from this project and the corrective actions for future projects:

Water Management

1. The headwater bypass pumping scheme proved to be adequate and effective.
2. The number of sumps required in the excavation areas was increased over initial estimates and the sump design was improved.
3. The pumping regimen was increased to a 24 hour/7 day a week operation to improve excavating conditions.
4. Filter bags were proven to be effective in controlling turbidity and sediment release.

Excavation

1. Excavation durations improved once work crews overcame the initial challenge in determining the sand/sediment interface.
2. Sounding of excavations aided in determining depth.
3. Excavation limits were verified prior to and after excavation.

Sediment Drying Pad Operation

1. The sediment proved to have poor draining properties.
2. Use of quicklime to drive off moisture was effective.
3. Equipment maneuverability on the sediment was difficult. Mat lanes were installed to improve accessibility.
4. Due to the physical characteristics of the sediment and the design of the railcars, it was necessary to switch from soft tarps to heavier burrito bag liners to ensure that sediments were not inadvertently released from the railcar.

8.0 COMMUNITY INVOLVEMENT

The community involvement process for the Peconic River cleanup has been an integral part of the planning, design, and execution of the project.

2000 Proposed Remedial Action Plan: A Proposed Plan for Operable Unit V was presented for public comment in the spring of 2000. Operable Unit V includes BNL's Sewage Treatment Plant (STP), abandoned sewer lines, groundwater related to STP operations, and the sediment in the upper portions of the Peconic River. The public comment period was originally scheduled to run from February 15 to March 15, 2000. Information sessions were held on February 23, 2000

(at BNL's Berkner Hall) and on February 29, 2000 (at Riverhead High School, Riverhead NY). The formal public meeting was held on March 2, 2000 at BNL's Berkner Hall.

The public comment period was extended to 90 days and concluded May 15, 2000. At that point, it was decided to separate the STP cleanup from the Peconic River cleanup. The STP Record of Decision (ROD) was issued in January 2002. The STP cleanup work has been completed.

A decision about the cleanup of the Peconic River sediment was deferred as a result of input received during the public comment period. Concerns submitted by members of the public ranged from doing no cleanup at all to increasing the scope of the cleanup. There also was concern about the potential for wetland damage. The public commented that the DOE needed to further evaluate new innovative technologies that might be able to clean up the sediment with less disruption to the wetlands. The stakeholders also requested that additional sampling of sediment, fish, and vegetation be conducted to provide better definition of the areas requiring cleanup. The DOE responded by completing a number of actions to better understand the level and type of contamination in the sediment and also investigated several technologies that potentially could clean the sediment with less disruption to the wetlands.

Technology Workshop: To explore alternative technologies, a Workshop was held in December 2000 that involved national and international environmental restoration companies. Regulatory agency staff, DOE and BNL staff, and community members attended the meeting. The workshop focused on the identification of alternative technologies that potentially could reduce wetland damage while achieving the necessary cleanup objectives. Four potential technologies (electrochemical remediation, native wetland plant phytoremediation, vacuum guzzling and sediment removal followed by wetland restoration) emerged from this workshop to further evaluate. Two of the four evaluated technologies were then selected for pilot testing, (vacuum guzzling and excavation followed by wetland restoration).

Peconic River Working Group: Additionally, DOE and the Lab formed the Peconic River Working Group. Members included local residents, representatives of several Suffolk County agencies, members of groups who have a particular interest in the Peconic River, and representatives of the Lab's Citizens Advisory Council. The working group was formed in December, 2001, and was active until February, 2003. The working group closely followed the pilot projects in the river test areas. They also provided input on the risk assessment process, and discussed the wetland restoration plans with representatives of New York State Department of Environmental Conservation.

Outreach: Project staff has made multiple presentations to the Community Advisory Council, the Brookhaven Executive Round Table, the Peconic Estuary Program, Suffolk County Legislature's Community Oversight Committee, and various local civic associations. Additionally, documents and information about the project are regularly posted to the web at http://www.bnl.gov/erd/peconic.html.

Action Memorandum Peconic River Removal Action for Sediment on BNL Property): The on-Laboratory property cleanup was conducted under a non-time critical removal action.

The public comment period was conducted from September 22, 2003 through October 21, 2003. It was announced in *Newsday* and *Suffolk Life* with advertisements and legal notices.

The documents were placed in the Administrative Record and made available on the BNL web site on September 19, 2003. Fact sheets were also mailed to more than 2,500 stakeholders. Information sessions were held on October 7 and 15, 2003. Presentations were made to the Laboratory's Community Advisory Council and the Brookhaven Executive Round Table.

2004 Proposed Remedial Action Plan: The public comment period for the 2004 Feasibility Study Addendum and the Proposed Remedial Action Plan ran from May 24 through June 25, 2004. The comment period was announced in *Newsday* and *Suffolk Life*. Advertisements for information roundtables and the public meeting were placed in *Newsday*, *Suffolk Life*, and the

Times Review and a BNL staff member canvassed neighborhoods and businesses near the cleanup area.

The EE/CA-AM and PRAP were placed in the Administrative Record, and on the BNL web site. Fact sheets were mailed to more than 2,500 stakeholders. Information sessions were held on June 3 (at Cornell Cooperative Extension in Riverhead, NY) and June 7, 2004 (at BNL's Berkner Hall). The formal public information session was held on June 15, 2004. Presentations were made to the Laboratory's Community Advisory Council and the Brookhaven Executive Round Table.

9.0 SUMMARY OF PROJECT COSTS

The Peconic River Cleanup Project was completed over a span of 12 months. All activities were performed in accordance with the requirements of the ROD and within 2% of the projected $11,461,000 total project cost as detailed in the *Feasibility Study Addendum Operable Unit V Peconic River* (BNL, 2004)

ENVIROCON

CONFIRMATORY SAMPLING LOG

10% QC Samples - PCBs

Project: Peconic River Remediation - Phase 1
Brookhaven National Laboratory

Project Number 14533-01

Count	ID #	Sample #	Date Taken	Sample location	Date shipped	Turnaround time	Requested analysis	Results rec'd	Lab Result (ug/kg)	Reporting Limit(ug/kg) & Comments

ENVIROCON

CONFIRMATORY SAMPLING LOG

10% QC Samples - PCBs

Project: Peconic River Remediation - Phase 1
Brookhaven National Laboratory

Project Number 14533-01

Count	ID #	Sample #	Date Taken	Sample location	Date shipped	Turnaround time	Requested analysis	Results rec'd	Lab Result (ug/kg)	Reporting Limit(ug/kg) & Comments

Area 3 samples-some were duplicates within a grid & were voided out of the average

running average for Mercury **0.185** *mg/kg*

Attachment I

Air Sampling Report
Peconic River Phase I

During the initial excavation and hauling tasks of the Peconic River Clean-up air sampling for elemental mercury and mercury salts (compounds) was conducted. The results of these tests are attached to this summary report.

Mercury Sampling

Mercury sampling was collected based on NIOSH Method 6009 using a filter cassette for collecting particulate material and an absorbent tube to collect mercury vapor. Sampling results detected only elemental mercury (vapor) in concentrations below the established exposure limits of OSHA, ACGIH (American Conference of Governmental Industrial Hygienists) and the action levels established by Envirocon in our site-specific Health and Safety Plan (HASP).

In addition a real-time air monitor (Jerome Mercury Vapor Analyzer) was used to test the material on the drying pad for any evolution of mercury vapor during storage and load-out operations. During this testing no mercury vapor was detected.

Monitor readings were taken at the face of the material on the drying pad, including material freshly exposed by the loader while material was being stockpiled. Testing was conducted during the excavation of areas 'A', 'B' and 'C' prior to any load out activities load-out.

In conclusion, under current conditions and practices we do not believe additional mercury air sampling is necessary. Periodic real-time monitoring will be conducted at sample hot spots and any other location where elevated levels of mercury are suspected.

Respirable Dust Sampling

Sampling for respirable and total dust was also conducted during Phase I tasks using NIOSH Methods 0500 and 0600. Testing primarily focused on haul truck operations and the operation of an open cab Bobcat on the unpaved perimeter roads at the site. These results are attached to this report. Based on the sampling results exposure to truck drivers and equipment operators on the site do not exceed the established exposure limits of OSHA, ACGIH (American Conference of Governmental Industrial Hygienists) as well as the action levels established by Envirocon in our site-specific Health and Safety Plan (HASP).

In conclusion, under current conditions and practices we do not believe additional air sampling is necessary. Current dust control measures are adequate to maintain operational efficiency without risk of dust levels exceeding H&S plan action levels.

5/25/04	Mercury	< 0.0005 mg/m3	0.1 mg/m3	7757 (EO)
5/27/04	Mercury	0.0014 mg/m3	0.1 mg/m3	2129 (Tk Dr)
5/27/04	Mercury	< 0.0004 mg/m3	0.1 mg/m3	7757 (EO)

Tk Dr Truck Driver
EO Equipment Operator

Area Sample (Taken inside operating equipment; machine operators changed during work day)

Equipment Operator samples collected from equipment operator/ equipment in use during the excavation of sediments in area A.
Truck diver samples collected from trucks hauling materials form area A.

Air Sampling Results

Date	Parameter	Result	OSHA Limit	Identifier
6/2/04	Mercury	< 0.002 mg/m3	0.1 mg/m3	7060 (L)
6/2/04	Mercury	< 0.0008 mg/m3	0.1 mg/m3	5324 (Tk Dr)
6/4/04	Mercury	< 0.0007 mg/m3	0.1 mg/m3	7060 (L)
6/4/04	Mercury	< 0.0007 mg/m3	0.1 mg/m3	2376 (EO)
6/7/04	Mercury	< 0.0008 mg/m3	0.1 mg/m3	2376 (EO)
6/7/04	Mercury	< 0.001 mg/m3	0.1 mg/m3	8253 (Eng)
6/9/04	Mercury	< 0.0008 mg/m3	0.1 mg/m3	2376 ((EO)
6/10/04	Mercury	< 0.002 mg/m3	0.1 mg/m3	7060 (L)

(EO) Equipment Operator
(L) Laborer
(Tk Dr) Truck Driver
(Eng) Engineer

Samples from Laborer/Engineer collected from workers on foot working in/around Peconic River in Areas A and B.
Truck diver samples collected from trucks hauling materials form area A and B.
Equipment operator samples collected from open cab bulldozer operating on drying pad.

Air Sampling Results

Date	Parameter	Result	OSHA Limit	Identifier
6/17/04	Resp. Dust	< 0.3 mg/m3	5.0 mg/m3	5520 (EO)
6/17/04	Resp. Dust	0.22 mg/m3	5.0 mg/m3	5520 (EO)
6/28/04	Resp. Dust	0.32 mg/m3	5.0 mg/m3	1195 (HSO)
6/28/04	Resp. Dust	0.12 mg/m3	5.0 mg/m3	5520 (EO)
6/30/04	Resp. Dust	< 0.2 mg/m3	5.0 mg/m3	1195 (HSO)

(EO) Equipment Operator
(HSO) Site Safety Officer

Note: The above samples do not represent a full shift exposure. The sampling method limits each sample to a maximum volume collection, due to trap limitations of the cyclone.

Samples times include:
1st sample on 6/17; 61 minutes
2nd sample on 6/17; 161 minutes (2 hr 41 min)
1st sample on 6/28; 137 minutes (2 hr 17 min)
2nd sample on 6/28; 211 minutes (3 hr 31 min)
sample on 6/30; 133 min (2 hr 13 min)

Samples collected during this time are lower by an order of magnitude of the OSHA exposure limit. They are also near an order of magnitude lower than the H&S plan action level. (2.5 mg/m3).

Equipment Operator samples collected from equipment operator operating open cab Bobcat on/near East Boundry/Fire Break Road, during dry road conditions.

Air Sampling Results

Date	Parameter	Result	OSHA Limit	Identifier
7/27/04	Resp. Dust	0.18 mg/m3	5.0 mg/m3	2129 (Tk Dr)
7/27/04	Resp. Dust	0.11 mg/m3	5.0 mg/m3	3545 (Tk Dr)
8/23/04	Total Dust	0.39 mg/m3	5.0 mg/m3	3545 (Tk Dr)
8/24/04	Total Dust	0.15 mg/m3	5.0 mg/m3	3545 (Tk Dr)

(Tk Dr) Truck Driver

Note: The above respirable dust samples represent a full shift exposure. The sampling method limits each sample to a maximum volume collection, due to trap limitations of the cyclone. Each Truck Driver was instructed to stop the sample pump, remove and empty the non-respirable fraction replace the cup and re-start the pump. Summary times are included below.

Samples times include:

1st Sample on 7/27; 351 minutes (summary of 121 minutes, 111 minutes, 61 minutes, 58 minutes)
2nd Sample on 7/27; 477 minutes (summary of 84 minutes, 107 minutes, 137 minutes, 149 minutes)
Sample on 8/23; 465 minutes (7 hr 45 min)
Sample on 8/24; 423 minutes (7 hr 3 min)

Samples collected during this time are lower by an order of magnitude of the OSHA exposure limit. They are also near an order of magnitude lower than the H&S plan action level. (2.5 mg/m3).

NOTES:

Air Monitoring with Jerome Mercury Vapor Analyzer

Air Monitoring performed between 0930 and 1000 on June 1, 2004

12 readings: < 0.001 mg/m3 (noted in daily log book # 1, Pg 68; 6/1/04)

Material on pad from Area A

Air Monitoring performed between 0930 and 1030 on July 1, 2004

12 readings: < 0.001 mg/m3 (noted in daily log book # 1, Pg 128; 7/1/04)

Material on drying pad from A, B, and C

Load-out of cars began 6/21/04
