**BROOKHAVEN NATIONAL LABORATORY**  
**2017 ENVIRONMENTAL MONITORING REPORT**  
**CURRENT AND FORMER LANDFILL AREAS**

***Executive Summary***

This report documents the Operations and Maintenance activities undertaken during the calendar year 2017 for the Current Landfill (AOC 3) and the Former Landfill Areas (Former Landfill AOC 2A, Interim Landfill AOC 2D, and Slit Trench AOC 2E). Brookhaven National Laboratory is responsible for performing this work to comply with the post-closure O&M requirements specified in 6 New York State Code of Rules and Regulations (NYCRR) Part 360, Solid Waste Management Facilities, updated November 4, 2017. The landfill caps are functioning as designed and the 2017 results are consistent with results from previous years.

**GROUNDWATER QUALITY**

The groundwater quality at both the Current and Former Landfill Areas remains relatively unchanged from 2016. Volatile organic compounds (VOCs) and metals continue to be detected downgradient of the Current Landfill. The most prevalent VOCs detected above standards are chloroethane, 1,1-dichloroethane and benzene, at maximum concentrations of 49 micrograms per liter ( $\mu\text{g/L}$ ), 32  $\mu\text{g/L}$  and 2  $\mu\text{g/L}$ , respectively. As with previous years, antimony, arsenic, iron, manganese, and sodium were detected downgradient from the Current Landfill at concentrations above applicable standards. Concentrations of these metals were similar to those detected historically. Maximum concentrations of aluminum, antimony, arsenic, iron, manganese, and sodium in downgradient wells were 862  $\mu\text{g/L}$ , 6  $\mu\text{g/L}$ , 21  $\mu\text{g/L}$ , 72,200  $\mu\text{g/L}$ , 5,790  $\mu\text{g/L}$ , and 41,800  $\mu\text{g/L}$ , respectively. These results are an indicator of continued low level leachate generation at this landfill. There were no detections of radionuclides above standards at the Current Landfill during 2017.

The *2016 Environmental Monitoring Report, Current and Former Landfill Areas*, increased the Sr-90 sampling frequency downgradient of the Former Landfill from bi-annual to annual for wells 097-64, 106-02, 106-43, 106-44, and 106-45 to monitor for any increasing concentration trends. The increasing trend of strontium-90 concentrations which was observed in well 097-64 over the past several years was not observed in 2017. The data from well 097-64 indicated a decreased strontium-90 concentration from 6.6 pCi/L in 2016 to 1.4 pCi/L in 2017. The strontium-90 concentrations for this monitoring well have remained below the groundwater standard of 8 pCi/L since 2000.

The groundwater monitoring well networks for the Current and Former Landfill Areas are adequate at this time. VOCs will continue to be monitored quarterly in Current Landfill wells 088-109 and OUI-MW01-2017 and strontium-90 will continue to be monitored annually in the five Former landfill monitoring wells.

In response to New York State Department of Environmental Conservation (NYSDEC)/New York State Department of Health (NYSDOH) and Suffolk County Department of Health Services (SCDHS) requests, BNL collected samples of the groundwater in December 2017 for 1,4-Dioxane analyses. Two of the monitoring wells sampled were located downgradient of the Current and Former Landfill Areas. These results are well below the current standard of 50  $\mu\text{g/L}$  for unspecified organic compounds.

## **1.0 INTRODUCTION**

This report documents the Operation and Maintenance (O&M) activities conducted and summarizes monitoring data collected during calendar year (CY) 2017 for the Current Landfill (Area of Concern [AOC] 3) and the Former Landfill Areas (Former Landfill AOC 2A, Interim Landfill AOC 2D, and Slit Trench AOC 2E). Brookhaven National Laboratory (BNL) is responsible for performing this work to comply with the post-closure O&M requirements specified in the 6 New York State Code of Rules and Regulations (6NYCRR) Part 360, Solid Waste Management Facilities, revised November 4, 2017. The details of the O&M programs are described in the Final Operations and Maintenance Manuals for the Current Landfill (CDM Federal, 1996a) and the Former Landfill Areas (CDM Federal, 1996b).

The following are the primary objectives of the O&M program:

- Monitor the effectiveness of the impermeable caps in protecting groundwater quality;
- Monitor the potential generation and migration of soil-gas; and
- Maintain and monitor the various components of the closure system (landfill caps, drainage structure, and environmental monitoring systems).

This is the twenty-second year of O&M for the Current Landfill, the twenty-first year for the Former Landfill and Slit Trench, and the twentieth year for the Interim Landfill.

### **1.1 Site Description and Project Background**

BNL is a 5,265-acre site located in central eastern Long Island, New York. The facility is a federally owned and funded international research and learning center managed by Brookhaven Science Associates (BSA) under contract with the United States Department of Energy (DOE). On December 21, 1989, the site was placed on the United States Environmental Protection Agency's (USEPA's) National Priorities List (NPL), a ranking of hazardous waste sites compiled by the federal government as part of the Comprehensive Environmental Response, Compensation and Liability Act

(CERCLA). Placing BNL on the NPL resulted in the establishment of a remediation task list for various locations around the facility. The site subsequently was divided into seven separate remediation work areas known as Operable Units (OU). The Current Landfill and Former Landfill Areas are located in OU I, near the south central portion of the BNL site (see Figure 1).

Current Landfill. The Current Landfill consists of one unlined waste-cell that operated from the late 1960s until 1990 for disposing of waste generated at the Laboratory. An impermeable cap covering the cell was completed in November 1995. Additional information about the cap's construction can be obtained from the *Construction Certification Report for the Current Landfill* (CDM Federal, 1996b). Following the installation of the cap, the post-closure groundwater monitoring program was implemented in January 1996, in accordance with 6 NYCRR Part 360 Section 2.15, Solid Waste Management Facilities (effective November 4, 2017).

Groundwater quality near the Current Landfill is monitored under the O&M program for a wide variety of volatile organic compounds (VOCs), metals, radiological, and water chemistry (landfill leachate) parameters. Monitoring in this vicinity was expanded in 1999 to include a wetland area adjacent to the landfill's eastern boundary. This area, known as the Wooded Wetland area, is a two-acre wetland located between the Former Hazardous Waste Management Facility (HWMF) and the Current Landfill. The wetland receives surface runoff from the Current Landfill and usually is flooded during the spring/early summer and dry in late summer/fall. Monitoring of the Wooded Wetland area was incorporated into the Current Landfill Monitoring Program and consisted of sampling and analyzing surface water and sediment annually through 2008, and then every other year to evaluate the potential for leachate migrating into this area, as originally performed under the *OU I Ecological Risk Assessment* (CDM Federal, 1999). In response to information provided in the *2015 Environmental Monitoring Report, Current and Former Landfill Areas* and additional tiger salamander information provided upon the request of the NYSDEC, it was agreed that further monitoring of the Wooded Wetlands be limited to visual tiger salamander assessments. No further sediment and surface water samples will be collected and care will be taken by BNL to not disturb the buildup of detritus material in the Wooded Wetland.

As required under 6 NYCRR Part 360, groundwater quality must be monitored for a minimum of

five years, after which the permittee may request modification of the sampling and analysis requirements. In October 2001, BNL submitted the *Five-Year Evaluation Report for the Current Landfill* (BNL, 2001). This report assessed groundwater trends over the five years after capping, and proposed changes to the sampling program. These changes were implemented in CY 2002. In July 2006, and March 2011 BNL issued the additional five-year review reports which discussed all remediation areas at the site. Review of the Current Landfill was included in these reports.

Former Landfill Area. The Former Landfill Area encompasses three closely located landfill units; the Former Landfill, the Slit Trench, and the Interim Landfill. The Former Landfill is an unlined waste-disposal area originally used by the United States Army starting in 1918. Waste disposal operations ceased in 1966, and the landfill was covered with soil. The Interim Landfill also is unlined, and was reportedly used for approximately one year between the time the Former Landfill was closed and the Current Landfill was opened. The Slit Trench is unlined as well, and is believed to have operated between 1960 and 1967 for disposal of construction and demolition debris (CDM Federal, 1996).

The Former Landfill and Slit Trench were capped in November 1996 and the Interim Landfill was capped in October 1997. Additional information about the construction of the caps can be found in the *Construction Certification Report for the Former Landfill* (Roy F. Weston, 1997) and *Construction Certification Report for the Interim Landfill Capping* (PW Grosser, 1997). BNL started O&M activities in December 1996 at the Former Landfill and Slit Trench, and in November 1997 at the Interim Landfill. Under this O&M program, groundwater quality in downgradient wells in the vicinity of the Former Landfill is monitored for VOCs, metals, radionuclides, and landfill-leachate parameters.

In March 2002, BNL submitted a *Five-Year Evaluation Report for the Former Landfill* (P.W. Grosser, 2002), which assessed trends in groundwater quality over the five-year period following capping and proposed changes to the sampling program. These changes were implemented in CY 2003. In July 2006 and March 2011, BNL issued the additional five-year review reports which discussed all remediation areas at the site. Review of the Former Landfill was included in these reports.

## 1.2 Overview of the Monitoring Program

### ***Groundwater Monitoring***

Data quality objectives (DQOs) for each of BNL's groundwater monitoring programs are presented in the *BNL Environmental Monitoring Plan* (BNL, 2017). The design of the data collection network was optimized as part of the process. Such optimization continues annually as part of the O&M program and is based on the interpretation of new data as well as historical trends. The primary DQO decision identified for the landfill monitoring programs is "Are the controls effectively improving groundwater quality below and downgradient of the landfill?"

Groundwater samples are collected from monitoring wells positioned upgradient and downgradient of each landfill area. Analytical data are reviewed, and determinations are made regarding the effectiveness of landfill controls.

The additional monitoring programs for the landfill areas consist of:

**Soil-gas Monitoring.** Measurements of methane, Lower Explosive Limit (LEL), and hydrogen sulfide are taken quarterly from monitoring locations surrounding the Current Landfill and annually from monitoring locations surrounding the Former Landfill to evaluate the movement of soil-gas from the landfills.

**Wooded Wetland Monitoring.** Surface water and sediment in the wooded wetland adjacent to the eastern boundary of the Current Landfill had been sampled every two years to evaluate possible effects of landfill leachate on tiger salamander habitats. Routine samples were last collected in 2016. Based on the historic results of the routine sampling, and the supplemental sampling conducted in December 2015, the NYSDEC agreed to allow BNL to discontinue the monitoring of the sediment and surface waters at the Wooded Wetlands. Tiger salamander monitoring will continue and be reported in a separate report. The Land Use and Institutional Controls factsheet for the Wooded Wetlands was updated to reflect the changes to monitoring and reporting.

**Routine Visual Inspection, Maintenance, and Repair.** Monthly inspections are performed to monitor the structural and/or operational status of the landfill caps, drainage structures, and environmental monitoring systems.

**Leachate Discharge.** Visual inspections of the landfills are performed monthly to monitor for

signs of leachate discharge. If observed, samples of the leachate are collected and analyzed. Leachate was not observed during 2017.

These activities are discussed in greater detail in Sections 2 through 4 of this report. Section 5 contains the conclusions and recommendations. References are included in Section 6.

## 2.0 GROUNDWATER MONITORING

### 2.1 Monitoring Well Networks

#### 2.1.1 Current Landfill

Since January 1996, groundwater quality at the Current Landfill has been monitored using eleven downgradient wells and one background monitoring well. Well OUI-MW01-2017 was added during 2017 to monitor downgradient VOC concentrations detected in monitoring well 088-109. Figure 2 depicts the location of the monitoring wells. Figure 3 shows the water table contours for this area in November 2017. The depths of the screen intervals for the Current Landfill wells are listed below.

Well ID	Screen Interval (ft BLS)	Screen Zone
087-09*	24–34	Shallow Glacial
087-11	11–21	Shallow Glacial
087-23	25–40	Shallow Glacial
087-24	70–80	Intermediate Glacial
087-26	70–80	Intermediate Glacial
087-27	5–20	Shallow Glacial
088-109	6–21	Shallow Glacial
088-110	10–25	Shallow Glacial
088-21	5–20	Shallow Glacial
088-22	70–80	Intermediate Glacial
088-23	120–130	Deep Glacial
OUI-MW01-2017	39.5–49.5	Intermediate Glacial

BLS = Below Land Surface

\*Background well

Screen zones were determined based on the following characteristics:

- Shallow Glacial Zone: typical water table within 10 ft of the screen zone.
- Intermediate Glacial Zone: typical water table between 10 ft and 100 ft above the screen zone.
- Deep Glacial Zone: typical water table >100 ft above the screen zone.

### **2.1.2 Former Landfill**

Since January 1997, groundwater quality at the Former Landfill area has been monitored using 14 shallow monitoring wells (three background and 11 downgradient). The locations of the 14 monitoring wells are presented in Figure 4. The direction of groundwater flow in the OU I area of the site is generally to the south-southeast. Figure 3 shows the November 2017 water table contours for the area. The screen zones for Former Landfill Area wells are summarized below.

Well ID	Screen Interval (ft BLS)	Screen Zone
086-42*	65-75	Intermediate Glacial
086-72*	41.5-56.5	Shallow Glacial
087-22*	43-53	Shallow Glacial
097-17	29-39	Shallow Glacial
097-64	29-44	Shallow Glacial
097-277	40-55	Shallow Glacial
106-02	55-65	Intermediate Glacial
106-30	29-44	Shallow Glacial
106-20	85-95	Intermediate Glacial
106-21	55-65	Shallow Glacial
106-43	43-53	Shallow Glacial
106-44	44-54	Shallow Glacial
106-45	44-55	Shallow Glacial
106-64	30-40	Shallow Glacial

BLS = Below Land Surface

\*Background well

Screen zones were determined based on the following characteristics:

- Shallow Glacial Zone: typical water table within 10 ft of the screen zone.
- Intermediate Glacial Zone: typical water table between 10 ft and 100 ft above the screen zone.

### **2.1.3 Sampling Frequency and Analytical Parameters**

The majority of monitoring wells for the Current Landfill were sampled semiannually, during June and October 2017 for VOCs, metals, and water chemistry parameters. A quarterly VOC sampling frequency was maintained for well 088-109 and OUI-MW01-2017, due to the continued presence of elevated levels of chloroethane. Radionuclides were sampled once, in October for wells 087-23, 087-27, 088-21, and 088-109.

Based on changes recommended in the *2012 Environmental Monitoring Report, Current and*

*Former Landfill Areas*, all Former Landfill Area wells were scheduled to be sampled every two years. The *2016 Environmental Monitoring Report, Current and Former Landfill Areas*, increased the Sr-90 sampling frequency from bi-annual to annual for wells 097-64, 106-02, 106-43, 106-44, and 106-45 to monitor for any increasing concentration trends. All other wells and parameters, which include VOCs, pesticides/PCBs, general chemistry, metals and radionuclides, are scheduled to be sampled in 2018.

R&C Formation, Ltd. of Babylon, New York conducted the groundwater sampling, and Test America of St. Louis, Missouri analyzed the samples. See Table 1 for a summary of analyses performed, by well and sampling round.

#### ***2.1.4 Quality Assurance / Quality Control***

The groundwater samples were collected and analyzed in accordance with strict quality assurance/quality control (QA/QC) requirements as described in the BNL SOPs for groundwater monitoring. The analytical results for groundwater samples collected during 2017 satisfied the data-quality objectives. The sampling team personnel are responsible for assuring that a master calibration/maintenance log is maintained for each field-measuring device (e.g., pH, conductivity, turbidity meters). The sample coordinator provided a calibration/maintenance log for equipment supplied to the contractor's sampling teams.

The analytical results of samples collected for the Current and Former Landfill Area projects underwent data verification, using BNL standard operating procedures EM-SOP-203, Chemical Data Verification, and EM-SOP-204, Radiochemical Data Verification. These procedures are designed to verify the accuracy and/or completeness of analytical data. The data verification process is implemented to detect the most common analytical problems that affect the quality of the results. To accomplish this task, QA/QC items such as the following were checked: holding times, matrix spikes, laboratory and field blanks, and field logs. If items are found that can affect the use and interpretation of the data, they are either corrected, as in the case of unreadable information on the field logs, or the data are "qualified," as in the case of contamination of the blanks or violations of the holding time.

Guidance on the collection of QA/QC samples is contained in the QAPP, and in BNL procedure

EM-SOP-200, Collection and Frequency of Field Quality Control Samples. The QA/QC samples collected included trip blanks, field blanks, matrix spike/matrix spike duplicate (MS/MSDs), and blind duplicates.

Trip blanks were analyzed for aqueous VOCs only. One trip blank was shipped to the analytical laboratory with each set of samples submitted for VOC analyses. One duplicate sample was collected from the Current Landfill during the second and fourth quarters. No errors were detected in the duplicate analyses. Matrix spike/matrix spike duplicate (MS/MSD) samples were collected at the same frequency as the duplicates. Sample results with concentrations of these compounds within the appropriate range of the associated blank value were declared non-detect. The amount of qualified data was within acceptable limits and did not adversely impact the review of the groundwater quality.

## 2.2 Landfill Groundwater Monitoring Results

This section summarizes the results for VOCs, metals, water-chemistry parameters, and radionuclides detected for the Current Landfill and radionuclide results for the Former Landfill Area in 2017. The historical trends in concentrations of key contaminants are assessed and shown graphically in Figures 5 through 9. Summary tables of all 2017 landfill groundwater data are presented in Tables 2 through 6. Detections that exceed groundwater standards are in bold text. The tables include groundwater standards, laboratory results, minimum detection limits, and laboratory data qualifiers.

The groundwater standards used for evaluating nonradiological groundwater data are those contained in the NYSDEC Division of Water Technical and Operational Guidance Series 1.1.1 Ambient Water Quality Standards and Guidance Values (June 1998, with addendums April 2000 and June 2004) (NYSDEC 1998, 2000, and 2004) and 6NYCRR Part 703.5. Groundwater standards for radiological isotopes were supplemented with New York State Department of Health's (NYSDOH's) strontium-90 and tritium standards for drinking water. There were no groundwater standards for the gamma constituents; therefore a Groundwater Screening Level was used. This value is based on a dose equivalent of 4 millirems (mrem)/year and was calculated as 4% of the DOE Derived Concentration Technical Standards (DCS) (DOE-STD-1196-2011) for the isotope of

concern. These values are listed under the “groundwater standards” column in the summary tables and annotated where appropriate. Laboratory results that exceed the lower of the groundwater standards or the Cleanup Goals listed in the Record of Decision (ROD) are highlighted in the data summary tables to facilitate review of the information.

The laboratory data qualifiers included in the tables vary for the different analyses. Explanations for the data qualifiers are included in the notes in each table. Complete 2017 laboratory data reports, chain of custody forms, and well-sampling logs for both landfills are archived and available upon request. In addition, analytical results are stored in the BNL Environmental Information Management System (EIMS) database.

## ***2.2.1 Current Landfill***

### ***2.2.1.1 Volatile Organic Compounds (VOCs)***

Benzene and chloroethane have historically been the primary groundwater contaminants detected downgradient of the Current Landfill. Benzene was detected above its standard of 1 microgram per liter ( $\mu\text{g}/\text{L}$ ) in monitoring well 087-11. 1,1-Dichloroethane was detected above the groundwater standards of 5  $\mu\text{g}/\text{L}$  in two downgradient monitoring wells, 088-109 and OUI-MW01-2017 during 2017 (Table 2). Chloroethane was detected in well 088-109 above the groundwater standards of 5  $\mu\text{g}/\text{L}$ . No other VOCs were detected above groundwater standards during 2017.

Benzene exceeded the 1  $\mu\text{g}/\text{L}$  standard in well 087-11 during the June and October sampling events. The highest detection of benzene was 2.1  $\mu\text{g}/\text{L}$  during the June event in well 087-11. Chloroethane exceeded the 5  $\mu\text{g}/\text{L}$  standard in well 088-109 during all four sampling events in 2017. The maximum chloroethane concentration was 49  $\mu\text{g}/\text{L}$  detected in well 088-109 during the October sampling event, which is well below the historic high of 560  $\mu\text{g}/\text{L}$  detected in this well in 1998. 1,1-Dichloroethane was detected above the standard of 5  $\mu\text{g}/\text{L}$  in well 088-109 during all four sampling events and in Well OUI-MW01-2017 during the October sampling event. The high concentration of 1,1-dichloroethane was 32  $\mu\text{g}/\text{L}$  in October in well 088-109. There is no apparent seasonal or water table elevation correlation with VOC concentrations in this well based on an assessment of historical data.

Figure 5 plots the concentration trends of total VOCs (TVOC), benzene, and chloroethane. As shown, VOCs remained relatively stable at low concentrations except for chloroethane in well 088-109. Overall, the trend plots also show a distinct decrease in VOC concentrations from the high concentrations seen prior to the installation of the cap. This reflects the positive effects of the capping on the groundwater quality downgradient of the landfill.

#### **2.2.1.2 Water Chemistry Parameters**

Groundwater samples near the Current Landfill were analyzed semi-annually for ammonia, total Kjeldahl nitrogen (TKN), cyanide, sulfate, nitrite, nitrate, total nitrogen, chloride, alkalinity, total dissolved solids (TDS or residue, nonfilterable), and total suspended solids (TSS or residue, filterable) during 2017 (Table 1). The results are provided in Table 3. Elevated levels of these parameters can be indicative of the presence of landfill leachate. During 2017, ammonia was the only water chemistry parameter detected above standards.

Ammonia was detected above the standard of 2 milligrams per liter (mg/L), with exceedances in downgradient well 088-109, as shown in Table 3. The highest concentration of 3.3 mg/L was reported for well 088-109 in October. The levels of ammonia detected in downgradient wells are consistent with historic data.

Chloride was not detected above the standard of 250 mg/L in any wells in 2017. Downgradient well 088-21 had the highest concentration of chloride at 67 mg/L in June. Figure 6 plots these trends. The trends for downgradient wells show the low levels of chloride concentrations in the vicinity of the Current Landfill.

Alkalinity, in the form of bicarbonate, is the concentration of anions available to neutralize acid, and is often used as an indicator of leachate contamination. The alkalinity in background well 087-09 ranged from 23 mg/L to 27 mg/L during 2017. The highest alkalinity concentration during 2017 was detected in downgradient, shallow Upper Glacial aquifer well 088-109, at 155 mg/L in October. There is no groundwater standard for alkalinity. The historical concentration trends plotted in Figure 6 show overall stable to decreasing levels of alkalinity.

During 2017, all sulfate concentrations remained below the groundwater standard of 250 mg/L. The highest sulfate value reported for 2017 was detected in the June sample from monitoring well 088-23 at a concentration of 18.5 mg/L. This is consistent with historic background levels at the Current Landfill.

TDS and TSS results were similar to those from previous years. TDS and TSS concentrations in background well 087-09 ranged from 137 mg/L to 164 mg/L, and nondetect to 0.6 mg/L, respectively. The maximum concentrations observed in downgradient wells were 273 mg/L and 70 mg/L of TDS and TSS, respectively.

No water chemistry parameters have exceeded groundwater standards in downgradient wells 087-24, 088-22, and 088-23, since 1998. These wells are all screened in the mid to deep-Upper Glacial aquifer to monitor the vertical extent of contamination from the Current Landfill. A comparison of downgradient and background wells shows that leachate continues to be generated from the Current Landfill, albeit at low concentrations. Decreasing to stable trends in concentrations of contaminants indicate that the capping continues to effectively reduce the generation and migration of leachate.

#### **2.2.1.3      *Metals***

Historically, iron is detected consistently above groundwater standards in the majority of wells surrounding the landfill. Precipitated iron from the BNL Water Treatment Plant was disposed of at the Current Landfill during past operations. Concentrations in upgradient well 087-09 are still lower than in several downgradient wells, suggesting continued leachate migration from the landfill into the groundwater.

During 2017, iron, and sodium in the background well, and aluminum, antimony, arsenic, iron, manganese, and sodium in several downgradient wells were detected above their respective groundwater standards (Table 4).

Aluminum was reported above the standard of 200 µg/L in wells 087-23 and 087-27 at a maximum concentration of 862 µg/L. These results are consistent with sporadic historic results reported for several Current Landfill wells, including background well 087-09.

Antimony was reported above the standard of 3 µg/L in wells 087-11 and 087-27. The maximum antimony concentration was 6.2 µg/L. The results are consistent with historic data.

Arsenic was reported above the standard of 10 µg/L in wells 087-23, 087-27, and 088-110 at a high concentration of 21 µg/L. Arsenic detections have historically been observed at similar levels in Current Landfill wells.

Iron was reported above the standard of 300 µg/L in all wells except 087-24, 088-21, and 088-22. The background concentrations ranged up to 479 µg/L while downgradient concentrations ranged up to 72,200 µg/L (well 087-11). Iron trend graphs are plotted on Figure 7.

Manganese ranged from 3 µg/L to 7 µg/L in background well 087-09, and up to 5,790 µg/L (well 087-23) in the downgradient wells.

Background and downgradient sodium levels ranged up to 41,800 µg/L. Chromium was not detected above the standard of 50 µg/L in any monitoring wells during 2017. Chromium was detected up to 47 µg/L in background well 087-09. Chromium was detected in downgradient wells at a high concentration of 3.2 µg/L in wells 087-23 and 088-110.

#### **2.2.1.4 Radionuclides**

No radionuclides were detected above groundwater standards during 2017 (Table 5). Strontium-90 was the only radionuclide detected during 2017. Strontium-90 was detected significantly below the groundwater standard of 8 pCi/L with a maximum value of 0.9 pCi/L in well 088-21 (Figure 8). Tritium and strontium-90 concentrations have not exceeded groundwater standards in any wells since 1998.

#### **2.2.2 Former Landfill**

Based on changes recommended in the *2012 Environmental Monitoring Report, Current and Former Landfill Areas*, monitoring wells were scheduled to be sampled every two years. Well 106-02 continues to be sampled annually for metals. The Former Landfill Area monitoring wells were last sampled during 2016 and are scheduled for their next sampling in 2018. Due to a slight increase in strontium-90 concentrations in monitoring well 097-64, the *2016 Environmental*

*Monitoring Report, Current and Former Landfill Areas*, recommended to increase the Sr-90 sampling frequency from bi-annual to annual for wells 097-64, 106-02, 106-43, 106-44, and 106-45 to monitor for any increasing concentration trends.

#### **2.2.2.1 Radionuclides**

The sampling results are summarized in Table 6, and concentration trend plots for Strontium-90 are shown on Figure 9. Strontium-90 was sampled for in wells 097-64, 106-02, 106-43, 106-44, and 106-45. All strontium-90 detections were below groundwater standards during 2017.

The highest strontium-90 result was in well 106-44 at 4.4 pCi/L. All strontium-90 concentrations decreased from 2016 values except well 106-44. Well 106-44 showed a slight increase from the 3.7 pCi/L 2016 strontium-90 concentration. This is well below the recorded high of 11.2 pCi/L detected in 2001 for this well.

The 2017 result for well 097-64 indicated a decreased strontium-90 concentration from 6.6 pCi/L in 2016 to 1.4 pCi/L in 2017.

### **2.3 1,4-Dioxane Monitoring**

In response to New York State Department of Environmental Conservation (NYSDEC)/New York State Department of Health (NYSDOH) and Suffolk County Department of Health Services (SCDHS) requests, BNL collected samples of the groundwater in December 2017 for 1,4-Dioxane analyses. The full results of this sampling event will be reported in the *2017 Annual Groundwater Status Report*. However, two of the monitoring wells sampled were located downgradient of the Current and Former Landfill Areas. The results for these wells are as follows:

Well ID	Project	Date Sampled	Depth (ft bsl)	1,4-Dioxane ( $\mu\text{g}/\text{L}$ )
088-109	Current Landfill	12/5/2017	13.5	0.711
106-30	Former Landfill	12/5/2017	36.5	ND

ft bsl Feet below land surface.

ND Not detected, <0.2  $\mu\text{g}/\text{L}$ .

These results are well below the current standard of 50 µg/L for unspecified organic contaminants. The 1,4-Dioxane results will be discussed on a site wide basis in the *2017 Annual Groundwater Status Report*.

## **3.0 SOIL-GAS MONITORING**

### **3.1 Soil-gas Monitoring Networks**

Soil-gas readings were collected from wells surrounding the Current Landfill in March, June, September, and December 2017 and from the Former Landfill in August 2017. Methane, lower explosive limit (LEL), and hydrogen sulfide were measured using a Landtek GEM 2000. The LEL for methane is 5.3% and the upper explosive limit (UEL) is 15%.

#### ***3.1.1 Current Landfill***

Along the perimeter of the Current Landfill, 58 points were sampled for soil-gas, which includes four outpost soil-gas well clusters, GSGM-1 to GSGM-4, located along the south side of Brookhaven Avenue. The sampling points include 12 soil-gas well clusters consisting of three sampling intervals per cluster, and 11 soil-gas well couplets consisting of two sampling intervals per couplet. Table 7 describes each soil-gas well adjacent to the landfill. Their locations are illustrated on Figure 10.

#### ***3.1.2 Former Landfill Area***

Twenty-four sampling points were monitored for the Former Landfill Area. These points include 12 well couplets consisting of two sampling points per couplet. Details of each soil-gas well are given in Table 7 and their locations shown in Figure 11.

#### ***3.1.3 Sampling Frequency***

Soil-gas was monitored for each landfill in the following months.

Sampling Event	Current Landfill	Former Landfill
Round 1	March 2017	August 2017
Round 2	June 2017	None
Round 3	September 2017	None
Round 4	December 2017	None

## **3.2 Results of Soil-Gas Monitoring**

Action levels for soil-gas are specified in 6 NYCRR Part 360-2.17(f) in terms of percent LEL, which is primarily related to the amount of methane present. This discussion focuses primarily on the methane levels detected during monitoring. Hydrogen sulfide is monitored, but has no regulatory action level. 6 NYCRR Part 360-2.17(f) specifies that active measures to control decomposition gases are required when the concentration of methane or other explosive gases exceeds 25 percent of the LEL (or 1.3% methane) in facility structures, or 100 percent (%) of the LEL (or 5.3% methane) at the site boundary.

### ***3.2.1 Current Landfill***

A total of 23 soil-gas monitoring well clusters are positioned around the Current Landfill (Figure 10) and were sampled quarterly during 2017. Potential receptors, or areas where methane can accumulate in the vicinity of the Current Landfill, include the National Weather Service office building located 480 feet north northwest of the Current Landfill on the north side of Brookhaven Avenue. The four outpost soil-gas locations, GSGM-1 to GSGM-4, located along the south side of Brookhaven Avenue, are used to monitor the northern extent of the migration of landfill gas. Should methane extend to the south side of Brookhaven Avenue at concentrations exceeding 25 percent of the LEL (or 1.3% methane), active measures may be required to control its migration. This is a BNL administration limit that would trigger further evaluation.

The results of the soil-gas monitoring for 2017 are summarized in Table 8. Appendix A contains the field notes recorded during the sampling events. Instrument measurements show that methane continues to be generated in several areas of the landfill. The percent of the LEL is elevated along the western side and the southeast boundary of the Current Landfill. In addition, two points, SGM-18 and SGM-19, along the northern side of the Current Landfill had elevated LEL readings. SGM-18 had elevated LEL readings in March and September while SGM-19 had elevated LEL readings in June and September. The elevated levels in these areas have remained stable since 1996 when monitoring began and the current gas venting system appears to be controlling gas accumulation. These data are consistent with previous years (see Appendix C).

Outpost wells, GSGM-1 to GSGM-4, located along the south side of Brookhaven Avenue showed no methane during 2017, indicating that the methane accumulation and migration does not extend to this area. Should methane at concentrations exceeding 25 percent of the LEL (or 1.3% methane) extend to these outpost wells on the south side of Brookhaven Avenue, active measures may be required to control its migration.

Hydrogen sulfide is a product of anaerobic decay in landfills and can produce an odor like rotten eggs. It is a nuisance, but rarely a toxicity problem. For reference, the National Institute of Occupational Safety and Health sets an exposure limit of 10 parts per million (ppm) hydrogen sulfide in the breathing zone for an 8-hour period.

Hydrogen sulfide measurements collected from the soil-gas monitoring wells ranged from 0 ppm to 58 ppm. Well SGMW-15B located along the east section of the landfill, had the highest hydrogen sulfide concentration, which was above the 10 ppm exposure limit. However, the measurement was taken from a vapor point screened –8.5 – 11.5 ft below the surface and not from the ambient breathing zone. Like methane, receptors to hydrogen sulfide are considered to be in areas such as basements where the gas can accumulate. Based upon the readings obtained from the outpost soil-gas wells along the south side of Brookhaven Avenue (GSGM-1 to GSGM-4), there is no evidence that hydrogen sulfide is migrating toward the National Weather Service building.

### ***3.2.1.1 Trend in Soil-Gas Data***

Appendix C contains the results of methane and hydrogen sulfide monitoring for the Current Landfill from 1996 through 2016. Generally the levels of methane and hydrogen sulfide in the wells along the northwest landfill boundary and southeast corner have remained elevated but stable.

### ***3.2.2 Former Landfill Area***

A total of 12 soil-gas monitoring well clusters are positioned around the Former Landfill Area (Figure 11). During 2017, the well clusters were monitored once in August. The only existing operating facility within the immediate vicinity of the Former Landfill Area is Building 670, located approximately 650 feet to the southeast. This building houses the Chemical Holes Sr-90

groundwater treatment system. Because this facility does not have a basement, there is minimal potential for hazardous levels of landfill gases to accumulate in this structure.

Based upon the sampling event, there was no methane or hydrogen sulfide detected. Table 9 details the 2017 soil-gas monitoring results for the Former Landfill Area. Appendix A contains the field notes recorded during the sampling events.

### ***3.2.2.1 Trends in Soil-Gas Data***

The results of monitoring the Former Landfill Area continue to be consistent with the initial survey of the methane gas migration conducted in 1995, during which concentrations between 0% to 0.1% methane were recorded. Methane has not been detected since 2005. Hydrogen sulfide gas also was measured during this survey. The hydrogen sulfide has not been detected since 2010. Appendix C includes the results of methane and hydrogen sulfide monitoring in the Former Landfill Area for 1996 through 2016.

Presently, there is no measured pathway for methane gas migration, nor do the concentrations represent an explosive hazard, as shown by the non-detectable readings on the LEL meter. The age of the Former Landfill Area and the types of materials disposed of would likely result in low levels or the absence of methane or hydrogen sulfide.

## **4.0 MAINTENANCE AND REPAIR**

Monthly site inspections were performed by BNL at the Current and Former Landfill areas to monitor the structural and/or operational status of the landfill cap, gas vents, drainage structure, fences and environmental monitoring system (groundwater wells, soil-gas wells) in accordance with the O&M Manuals. A copy of the inspection reports is included in Appendix B. Maintenance and repair work completed by BNL is discussed below.

### **4.1 Landfill Cap and Gas Vents**

To prevent ruts in the landfills caused by the weight of the lawn mowers during periods of above normal precipitation, the cutting of the grass is only conducted when optimal soil conditions are evident. The grass was cut during June and October at the Current and Former Landfills. Phragmites impinging on the asphalt access road at the Current Landfill were cut back. Small pine seedlings observed growing on the edge of the Former Landfill cap were either hand pulled or cut back mechanically. The seedlings only penetrated the top soil cover. An animal burrow on the north slope of the Current Landfill and one on the south slope of the Former Landfill were filled in and seeded. The burrows did not penetrate past the protection layer of the cap.

### **4.2 Drainage Structures**

The drainage structures at both the Current and Former Landfill areas were maintained. They were observed to be operational and structurally sound during the site inspections. Small pine seedlings and weeds were noted growing in the drainage channels of both landfills during various times of the year. The weeds died off as cold weather set in. If they grow back in sufficient numbers, they will either be cut back or sprayed with herbicide in 2018.

### **4.3 Environmental Monitoring System**

The monitoring wells and soil-gas monitoring wells associated with the landfills required no significant maintenance. Access to the soil-gas monitoring wells was cleared via mechanical weed whacking prior to each sampling event.

#### **4.4 Related Structures**

No structures required maintenance during 2017.

## **5.0 CONCLUSIONS AND RECOMMENDATIONS**

### **5.1 Groundwater Monitoring**

#### ***5.1.1 Conclusions for the Current Landfill***

- Benzene was detected in downgradient well 087-11 at concentrations slightly above the groundwater standard with a maximum concentration of 2.1 µg/L. The other VOCs detected above the groundwater standard were chloroethane and 1,1-dichloroethane during 2017. 1,1-Dichloroethane was detected in two monitoring wells above the standard of 5 µg/L, 088-108 and OUI-MW01-2017. The maximum concentration of 1,1-dichloroethane during 2017 was 32 µg/L. During 2017, chloroethane concentrations ranged up to 49 µg/L indicating that VOCs continue to emanate from the landfill. An analysis of the trends of VOCs indicated the concentrations are stable to decreasing. These concentrations are naturally attenuating and are not detected at the site boundary above the drinking water standard.
- Concentrations of landfill water chemistry parameters and metals such as ammonia and iron in several downgradient wells were above the upgradient values. This suggests that leachate continues to emanate from the landfill into groundwater. Ammonia was detected above the standard of 2 mg/L in downgradient well 088-109 at a high of 3.3 mg/L.
- During 2017, iron, and sodium in the background well, and aluminum, antimony, arsenic, iron, manganese, and sodium in several downgradient wells were detected above their respective groundwater standards.
- Strontium-90 was detected in well 088-21 downgradient of the Current Landfill, but at concentrations well below groundwater standards. This is consistent with historical observations. There have been no detections of radionuclides above the drinking water standards since 1998.
- Although low levels of contaminants continue to be detected, the landfill controls are effective at reducing the impact of the Current Landfill on groundwater quality as evidenced by the improving quality of groundwater downgradient of the landfill.

### ***5.1.2 Recommendations for the Current Landfill***

The monitoring well network for the Current Landfill is sufficient. No changes to the network or the sampling frequency are warranted at this time.

### ***5.1.3 Conclusions for the Former Landfill Area***

- All strontium-90 detections were below the groundwater standard of 8 pCi/L during 2017. The highest strontium-90 result was in well 106-44 at 4.4 pCi/L. The Strontium-90 results are consistent with historic data.

### ***5.1.4 Recommendations for the Former Landfill Area***

- The monitoring well network and sampling schedule for the Former Landfill are sufficient. No changes are warranted at this time. A full round of monitoring will be conducted in 2018.

## **5.2 Soil-Gas Monitoring**

### ***5.2.1 Conclusions for the Current Landfill***

Methane and/or hydrogen sulfide levels in wells located along the west landfill boundary, north landfill boundary and southeast corner have remained stable and have not shown any significant increases or decreases over time. No gas migration has been observed this year at the outpost soil-gas wells along Brookhaven Avenue. No methane or hydrogen sulfide were detected in the three temporary soil-gas wells installed south east of the Current Landfill.

### ***5.2.2 Recommendations for the Current Landfill***

The soil-gas monitoring program is adequate at this time.

### ***5.2.3 Conclusions for the Former Landfill Area***

Methane and hydrogen sulfide levels at the Former Landfill Area continue to show no landfill gas. Methane has not been detected near or above standards since monitoring began in 1996.

### ***5.2.4 Recommendations for the Former Landfill Area***

The soil-gas monitoring program is adequate at this time.

## **5.3 Maintenance and Repair**

Maintenance of the landfill caps will continue in accordance with the O&M requirements.

### ***5.3.1 Current Landfill***

Monthly inspections and maintenance will continue in accordance with the O&M requirements.

Access to the soil-gas monitoring wells will continue to be cleared via mechanical weed whacking.

Continue removal of small pines and weeds in the drainage channel during 2018.

### ***5.3.2 Former Landfill Area***

Monthly inspections and maintenance will continue in accordance with the O&M requirements.

Access to the soil-gas monitoring wells will continue to be cleared via mechanical weed whacking.

Continue removal of small pines and weeds in the drainage channel during 2018.

## Appendix B

### Monthly Landfill Site Inspection Forms

BROOKHAVEN NATIONAL LABORATORY  
CURRENT LANDFILL AREA  
SITE INSPECTION FORM

Name of Inspector(s):

Eric Kramer

Date of Inspection:

1-26-17

Purpose of Inspection:

Routine    Heavy Rainfall    Reported Incident

Time on Site:

\_\_\_\_\_

Time off Site:

\_\_\_\_\_

Weather Conditions:

\_\_\_\_\_

A. Inspection Checklist

Component	Observed Condition			Further Action Required	
	Excellent	Fair	Poor	Yes	No
1.0 Landfill Cap: Vegetation Cap Gas Vents	X				X
2.0 Drainage Structures: Toe Drain Drainage Channels French Drains/Outfalls Subsurface Drainage Pipes/Outfalls Manholes Recharge Areas	X				X
Monitoring System: Soil Gas Wells Groundwater Wells	X				X
4.0 Site Access: Asphalt Access Road Crushed-Concrete Access Road	X				X

B. Description of Further Action Requirements:

1. Location:

All OK

Observed Conditions:

Recommendations:

BROOKHAVEN NATIONAL LABORATORY  
CURRENT LANDFILL AREA  
SITE INSPECTION FORM

Name of Inspector(s):

Eric Kramer

Date of Inspection:

2-23-17

Purpose of Inspection:

Routine    Heavy Rainfall    Reported Incident

Time on Site:

\_\_\_\_\_

Time off Site:

\_\_\_\_\_

Weather Conditions:

\_\_\_\_\_

A. Inspection Checklist

Component	Observed Condition			Further Action Required	
	Excellent	Fair	Poor	Yes	No
1.0 Landfill Cap: Vegetation Cap Gas Vents	X				X

	X					X
<b>5.</b> Evidence of unauthorized work activities and/or unauthorized access has occurred? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No If yes, describe evidence: _____						

## B. Description of Other Observations

Observed Conditions/Recommendations: The grass on the cap was recently cut. Some ruts were identified on the slopes from the mowers due to spongy conditions from previous rain. Facilities and Operations cut the vegetation around the soil gas and groundwater monitoring wells, and reeds encroaching near the asphalt roadway. All three point of contact signs are in place and gates locked. The Wooded Wetland had some standing water. LUIC Factsheet Changes: No changes for Current Landfill. For the Wooded Wetlands, update Current Conditions to reflect that sediment and surface water monitoring for metals was discontinued following the 2016 collection.

## B. Description of Other Observations

Observed Conditions/Recommendations: Former Landfill, Interim Landfill, and Slit Trench caps are in good condition. Only two shallow animal burrows were observed on the Former Landfill, which were filled in at the time of inspection. The grass on all three landfills was not yet cut this spring. There is some vegetation in the drainage channels, which will be addressed by Facilities and Operations maintenance activities. The asphalt on the west side of the landfill is starting to deteriorate. All contact signs were in place. LUIC Factsheet Changes: None.

## B. Description of Other Observations

Observed Conditions/Recommendations: Former Landfill, Interim Landfill, and Slit Trench caps are in good condition. There was one deep woodchuck burrow observed on the Former Landfill south slope, which was identified and reported during the July monthly inspection. Facilities and Operations (F&O) failed to make the repairs back in July and were notified again on 10/18/17. The grass on all three landfills were recently cut. There is significant vegetation in the drainage channels and two pine seedlings growing on the south slope which need to be addressed by F&O. The asphalt on the west side of the landfill continues to slowly deteriorate. All contact signs were in place. LUIC Factsheet Changes: None.
