Narrative

CASE NARRATIVE

Client: FPM Remediation Inc

Project: BNL Decommissioning Project

Report Number: 160-38495-4

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The samples were received on 06/24/2020; the samples arrived in good condition, properly preserved. The temperature of the coolers at receipt was 23.6 C.

Narrative

CASE NARRATIVE

Client: FPM Remediations Inc

Project: BNL Decommissioning Project

Report Number: 160-38687-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The samples were received on 7/15/2020 9:03 AM; the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 26.4º C.

Preparation Batch 160-477440:
Due to the sample matrices, the following samples were under the target preparation weight of 260g. The samples were low density ground solids: HFBR-002-070720 (160-38687-2), HFBR-003-070720 (160-38687-3), HFBR-004-070720 (160-38687-4), HFBR-005-070820 (160-38687-5), HFBR-006-070820 (160-38687-6), HFBR-007-070820 (160-38687-7), HFBR-008-070820 (160-38687-8), and HFBR-009-070820 (160-38687-9).

The radium-226 detection goal was not met. This is due to elevated Compton backgrounds from activity in the samples (i.e. cesium-137): HFBR-007-070820 (160-38687-7), HFBR-008-070820 (160-38687-8), and HFBR-009-070820 (160-38687-9).

For samples HFBR-001-070720 (160-38687-1), HFBR-002-070720 (160-38687-2), HFBR-003-070720 (160-38687-3), HFBR-004-070720 (160-38687-4), HFBR-005-070820 (160-38687-5), HFBR-006-070820 (160-38687-6), HFBR-007-070820 (160-38687-7), HFBR-008-070820 (160-38687-8), HFBR-009-070820 (160-38687-9), (LCS 160-477440/2-A), (MB 160-477440/1-A), (460-213106-A-4-B), and (460-213106-A-4-C DU) many isotopes requested for analysis do not have any gamma emissions, or the gamma emissions they do have are very poor. Often, such analytes are reported by gamma spectrometry assuming secular equilibrium with a longer-lived parent. The client should ensure that such inference is acceptable for their sample based upon process knowledge. The following assumptions were made for this report:

Preparation Batch 160-478741:
The matrix spike recovery (69%) was outside the lower control limit (78%). Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits. While the sample duplicate RPD (25%), RER (0.97), and DER (2.74) are all within limits, they are all toward the upper end, also suggesting potential sample non-homogeneity: (160-38687-C-1-B MS).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

POTENTIAL HAZARDS

HEALTH:

- Radiation presents minimal risk to transport workers, emergency response personnel, and the public during transportation accidents. Packaging durability increases as potential hazard of radioactive content increases
- Very low levels of contained radioactive materials and low radiation levels outside packages result in low risks to people. Damaged packages may release measurable amounts of radioactive material, but the resulting risks are expected to be low.
- Some radioactive materials cannot be detected by commonly available instruments.
- Packages do not have RADIOACTIVE I, II, or III labels. Some may have EMPTY labels or may have the word "Radioactive" in the Package marking.

Fire or Explosion

- Some of these materials may burn, but most do not ignite readily
- Many have cardboard outer packaging; content (physically large or small) can be of many different physical forms.
- Radioactivity does not change flammability or other properties of materials.

PUBLIC SAFETY

- CALL Emergency Response Telephone Number on Shipping Paper first. If Shipping Paper not available or no answer, refer to appropriate telephone number listed on the inside back cover. (**Emergency Contact number is also listed on this page**).
- Priorities for rescue, life-saving, first aid, and control of fire and other hazards are higher than the priority for measuring radiation levels.
- Radiation Authority must be notified of accident conditions. Radiation Authority is usually responsible for decisions about radiological consequences and closure of emergencies.
- As an immediate precautionary measure, isolate sill or leak area for at lease 25 meters (75 feet) in all directions.
- Stay upwind.
- Keep authorized personnel away.
- Detain or isolate uninjured persons or equipment suspected to be contaminated; delay decontamination and cleanup until instructions are received from Radiation Authority.

PROTECTIVE CLOTHING

- Positive pressure self-contained breathing apparatus (SCBA) and structural firefighters' protective clothing will provide adequate protection.

EVACUATION

Large Spill

- Consider initial downwind evacuation for at least 100 meters (330 feet).

Fire

- When a large quantity of this material is involved in a major fire, consider an initial evacuation distance of 300 meters (1000 feet) in all directions.

EMERGENCY RESPONSE

FIRE

- Presence of radioactive material will not influence the fire control processes and should not influence selection techniques.
- Move containers from fire area if you can do it without risk.
- Do not remove damaged packages; move undamaged packages out of fire zone.

Small Fires

- Dry chemical, CO_2 water spray or regular foam.

Large Fires

- Water Spray, fog (flooding amounts).

SPILL OR LEAK

- Do not touch damaged packages or spilled material.
- Cover liquid spill with sand, earth or other noncombustible abosrbent material.
- Cover powder spil with plastic sheet or tarp to minimize spreading.

FIRST AID

- Call 911 or emergency medical service
- Medical problems take priority over radiological concerns.
- Use first aid treatment according to the nature of the injury.
- Do not delay care and transport of a seriously injured person.
- Give artifical respiration if victim is not breathing.
- Administer oxygen if breathing is difficult.
- In case of contact with substance, immediately flush skin or eyes with running water for at least 20-minutes
- Injured persons contaminated by contact with released material are not a serious hazard to health care personnel, equipment or facilities.
- Ensure that medical personnel are aware of the material(s) involved, take precautions to protect themselves and prevent spread of contamination.

Narrative

CASE NARRATIVE

Client: FPM Remediations Inc

Project: BNL Decommissioning Project

Report Number: 160-38687-2

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The samples were received on 7/15/2020 9:03 AM; the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 26.4º C.

Narrative

CASE NARRATIVE

Client: Cabrera Services

Project: BNL Decommissioning Project

Report Number: 160-38495-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client.

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The samples were received on 06/24/2020; the samples arrived in good condition, properly preserved. The temperature of the coolers at receipt was 23.6° C.

Narrative

CASE NARRATIVE

Client: Cabrera Services

Project: BNL Decommissioning Project

Report Number: 160-38495-2

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The samples were received on 6/24/2020 1:15 PM; the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 23.6º C.

Narrative

CASE NARRATIVE

Client: Cabrera Services

Project: BNL Decommissioning Project

Report Number: 160-38495-3

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The samples were received on 6/24/2020 1:15 PM; the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 23.6º C.

Laboratory: Eurofins TestAmerica, St. Louis (Continued)

Samples with identical identification prefixes were composited for analysis per client request. The new sample IDs contain "COMP" after the initial prefix: HFBR-D007-061820 COMP (160-38495-29), HFBR-D008-061820 COMP (160-38495-30), HFBR-D009-061820 COMP (160-38495-31), and HFBR-D020-061820 COMP (160-38495-32).

CESIUM 137 AND OTHER GAMMA EMITTERS (GS)

Samples HFBR-D007-061820 COMP (160-38495-29), HFBR-D008-061820 COMP (160-38495-30), HFBR-D009-061820 COMP (160-38495-31) and HFBR-D020-061820 COMP (160-38495-32) were analyzed for Cesium 137 and Other Gamma Emitters (GS) in accordance with EPA Method 901.1. The samples were prepared on 07/06/2020 and analyzed on 07/07/2020.

Preparation Batch 160-475402:
The sample exhibited a negative result greater in magnitude than the 3 sigma TPU for Th-234. This occurrence was evaluated and determined to be random in nature. Sporadic occurrences such as this are statistically expected: HFBR-D008-061820 COMP (160-38495-30).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Narrative

CASE NARRATIVE

Client: FPM Remediations Inc

Project: BNL Decommissioning Project

Report Number: 160-41496-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The samples were received on 3/18/2021 9:25 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 3 coolers at receipt time were 12.9º C, 13.1º C and 13.9º C.

Samples 160-41496-1-18 contained detritus: RA-001-031721 (160-41496-1), RA-201-031721 (160-41496-2), RA-002-031721 (160-41496-3), RA-003-031721 (160-41496-4), RA-004-031721 (160-41496-5), RA-005-031721 (160-41496-6), RA-006-031721 (160-41496-7), RA-007-031721 (160-41496-8), RA-008-031721 (160-41496-9), RA-009-031721 (160-41496-10), RA-010-031721 (160-41496-11), RA-011-031721 (160-41496-12), RA-211-031721 (160-41496-13), RA-012-031721 (160-41496-14), RA-013-031721 (160-41496-15), RA-014-031721 (160-41496-16), RA-015-031721 (160-41496-17), and RA-016-031721 (160-41496-18).

The following samples were filtered through a 0.35 micron filter before 1 M ammonium citrate was added: RA-001-031721 (160-41496-1), RA-201-031721 (160-41496-2), RA-002-031721 (160-41496-3), RA-003-031721 (160-41496-4), RA-004-031721 (160-41496-5), RA-005-031721 (160-41496-6), RA-006-031721 (160-41496-7), RA-007-031721 (160-41496-8), RA-008-031721 (160-41496-9), RA-009-031721 (160-41496-10), RA-010-031721 (160-41496-11), RA-011-031721 (160-41496-12), RA-211-031721 (160-41496-13), RA-012-031721 (160-41496-14), RA-013-031721 (160-41496-15), RA-014-031721 (160-41496-16), RA-015-031721 (160-41496-17), and RA-016-031721 (160-41496-18).

Sample 160-41392-1 contained small rocks: RA-001-031721 (160-41496-1), RA-201-031721 (160-41496-2), RA-002-031721 (160-41496-3), RA-003-031721 (160-41496-4), RA-004-031721 (160-41496-5), RA-005-031721 (160-41496-6), RA-006-031721 (160-41496-7), RA-007-031721 (160-41496-8), RA-008-031721 (160-41496-9), RA-009-031721 (160-41496-10), RA-010-031721 (160-41496-11), RA-011-031721 (160-41496-12), RA-211-031721 (160-41496-13), RA-012-031721 (160-41496-14), RA-013-031721 (160-41496-15), RA-014-031721 (160-41496-16), RA-015-031721 (160-41496-17), RA-016-031721 (160-41496-18) and (160-41496-D-1-A DU).

The following samples contained sediment after digestion and dissolution. All of the samples, MB, and LCS were filtered through a 0.45 micron filter before columns. The samples contained detritus. Sample 160-41392-1 contained small rocks: RA-001-031721 (160-41496-1), RA-201-031721 (160-41496-2), RA-002-031721 (160-41496-3), RA-003-031721 (160-41496-4), RA-004-031721 (160-41496-5), RA-005-031721 (160-41496-6), RA-006-031721 (160-41496-7), RA-007-031721 (160-41496-8), RA-008-031721 (160-41496-9), RA-009-031721 (160-41496-10), RA-010-031721 (160-41496-11), RA-011-031721 (160-41496-12), RA-211-031721 (160-41496-13), RA-012-031721 (160-41496-14), RA-013-031721 (160-41496-15), RA-014-031721 (160-41496-16), RA-015-031721 (160-41496-17), RA-016-031721 (160-41496-18), and (160-41496-D-1-A DU).

Narrative

CASE NARRATIVE

Client: FPM Remediations Inc

Project: BNL Decommissioning Project

Report Number: 160-41700-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The samples were received on 4/14/2021 9:05 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 2.1º C.

RADIUM-226 BY GAMMA SPEC (21 DAY INGROWTH)

Job ID: 160-41700-1 (Continued)

Laboratory: Eurofins TestAmerica, St. Louis (Continued)

Samples RA-017-041321 (160-41700-1), RA-018-041321 (160-41700-2), RA-019-041321 (160-41700-3), RA-020-041321 (160-41700-4), RA-220-041321 (160-41700-5), RA-021-041321 (160-41700-6) and RA-022-041321 (160-41700-7) were analyzed for Radium-226 by gamma spec (21 day ingrowth) in accordance with EPA GA_01_R. The samples were leached on 04/22/2021, prepared on 04/26/2021 and analyzed on 05/17/2021.

Preparation Batch 160-507122:
The detection goal of 0.200 pCi/g was not met for Ra-226 for the following sample. An elevated DLC can occur when higher background counts are applied to a peak ROI. This is due to the relatively small size of the peak or subsequent “force-fit” of the non-existent peak which resulted in higher than normal background counts due to statistical fluctuations in the Compton background. The laboratory does not believe this adversely affects the data, and the Ra-226 activity is below the RL and DLC: (190-25727-A-1-A) and (190-25727-A-1-B DU).

Insufficient sample was available after the dry and grind preparation to fill the standard geometry (tuna can) calibrated for Ra-226 analysis by gamma spectroscopy. The use of a geometry with headspace could potentially bias the results low due to the loss of radon into the headspace of the container. The Ra-226 detection goal was not met due to the reduced aliquot: RA-018-041321 (160-41700-2).

For samples RA-017-041321 (160-41700-1), RA-018-041321 (160-41700-2), RA-019-041321 (160-41700-3), RA-020-041321 (160-41700-4), RA-220-041321 (160-41700-5), RA-021-041321 (160-41700-6), RA-022-041321 (160-41700-7), (LCS 160-507122/2-A), (MB 160-507122/1-A), (190-25727-A-1-A), and (190-25727-A-1-B DU) many isotopes requested for analysis do not have any gamma emissions, or the gamma emissions they do have are very poor. Often, such analytes are reported by gamma spectrometry assuming secular equilibrium with a longer-lived parent. The client should ensure that such inference is acceptable for their sample based upon process knowledge. The following assumptions were made for this report:

CASE NARRATIVE

Client: FPM Remediations Inc

Project: BNL Decommissioning Project

Report Number: 160-39520-1 - Revision 1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client. This revision adds the correct data for the asbestos analysis.

RECEIPT

The Pb samples were direct shipped to ETA Phoenix and arrived on 9/10/2020 10:00 AM at ambient temperature. The asbestos samples were direct shipped to J3 Resources, Inc and arrived on 9/10/2020 11:20 AM at ambient temperature. All samples arrived in good condition.

CASE NARRATIVE

Client: FPM Remediations Inc

Project: BNL Decommissioning Project

Report Number: 160-39710-1 - Revision 1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client. This revision adds notes for two additional Pb samples submitted for analysis.

RECEIPT

The samples were direct shipped to ETA Phoenix and arrived on 9/22/2020 at ambient temperature. The asbestos samples were forwarded to J3 Resources, Inc and arrived on 9/23/2020 at ambient temperature. All samples arrived in good condition.

CASE NARRATIVE

Client: FPM Remediations Inc

Project: BNL Decommissioning Project

Report Number: 160-39948-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The samples were direct shipped to ETA Phoenix and arrived on 9/26/2020 at ambient temperature. The asbestos samples were forwarded to J3 Resources, Inc and arrived on 9/29/2020 at ambient temperature. All samples arrived in good condition.

CASE NARRATIVE

Client: FPM Remediations Inc

Project: BNL Decommissioning Project

Report Number: 160-39953-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The samples were direct shipped to ETA Phoenix and arrived on 10/08/2020 at ambient temperature. The asbestos samples were forwarded to J3 Resources, Inc and arrived on 10/09/2020 at ambient temperature. All samples arrived in good condition.

CASE NARRATIVE

Client: FPM Remediations Inc

Project: BNL Decommissioning Project

Report Number: 160-39955-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

CASE NARRATIVE

Client: FPM Remediations Inc

Project: BNL Decommissioning Project

Report Number: 160-40599-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

CASE NARRATIVE

Client: FPM Remediations Inc

Project: BNL Decommissioning Project

Report Number: 160-40673-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

These results apply to the sample(s) as received. The analysis has been conducted according to the method(s) listed above. Blank corrections are not applied to data unless requested by the customer. This report is for the exclusive use of the addressed customer and shall not be reproduced, except in full, without written approval of Eurofins J3 Resources, Inc. (J3). Unless otherwise noted, all quality control samples performed within specifications established by the laboratory. J3 is not responsible for reported results that are dependent on volumes provided by non-laboratory personnel. Samples exceeding the method recommended dust loading of 2 mg/filter are fractionated to determine the total respirable crystalline silica mass and concentration. The reported Respirable Crystalline Silica value is based on recovery of polymorphs Quartz, Cristobalite, and/or Tridymite at levels greater than their respective reporting limits. The possible presence of crystalline silica polymorphs at levels less than reporting limits cannot be ruled out. When all polymorph results are below reporting limits, Respirable Crystalline Silica is reported as less than the lowest polymorph reporting limit concentration.

These results apply to the sample(s) as received. The analysis has been conducted according to the method(s) listed above. Blank corrections are not applied to data unless requested by the customer. This report is for the exclusive use of the addressed customer and shall not be reproduced, except in full, without written approval of Eurofins J3 Resources, Inc. (J3). Unless otherwise noted, all quality control samples performed within specifications established by the laboratory. J3 is not responsible for reported results that are dependent on volumes provided by non-laboratory personnel. Samples exceeding the method recommended dust loading of 2 mg/filter are fractionated to determine the total respirable crystalline silica mass and concentration. The reported Respirable Crystalline Silica value is based on recovery of polymorphs Quartz, Cristobalite, and/or Tridymite at levels greater than their respective reporting limits. The possible presence of crystalline silica polymorphs at levels less than reporting limits cannot be ruled out. When all polymorph results are below reporting limits, Respirable Crystalline Silica is reported as less than the lowest polymorph reporting limit concentration.

These results apply to the sample(s) as received. The analysis has been conducted according to the method(s) listed above. Blank corrections are not applied to data unless requested by the customer. This report is for the exclusive use of the addressed customer and shall not be reproduced, except in full, without written approval of Eurofins J3 Resources, Inc. (J3). Unless otherwise noted, all quality control samples performed within specifications established by the laboratory. J3 is not responsible for reported results that are dependent on volumes provided by non-laboratory personnel. Samples exceeding the method recommended dust loading of 2 mg/filter are fractionated to determine the total respirable crystalline silica mass and concentration. The reported Respirable Crystalline Silica value is based on recovery of polymorphs Quartz, Cristobalite, and/or Tridymite at levels greater than their respective reporting limits. The possible presence of crystalline silica polymorphs at levels less than reporting limits cannot be ruled out. When all polymorph results are below reporting limits, Respirable Crystalline Silica is reported as less than the lowest polymorph reporting limit concentration.

These results apply to the sample(s) as received. The analysis has been conducted according to the method(s) listed above. Blank corrections are not applied to data unless requested by the customer. This report is for the exclusive use of the addressed customer and shall not be reproduced, except in full, without written approval of Eurofins J3 Resources, Inc. (J3). Unless otherwise noted, all quality control samples performed within specifications established by the laboratory. J3 is not responsible for reported results that are dependent on volumes provided by non-laboratory personnel. Samples exceeding the method dust loading limit of 2 mg/filter are fractionated to determine the total respirable crystalline silica mass and concentration. The reported Respirable Crystalline Silica value is based on recovery of polymorphs Quartz, Cristobalite, and/or Tridymite at levels greater than their respective reporting limits. The possible presence of crystalline silica polymorphs at levels less than reporting limits cannot be ruled out. When all polymorph results are below reporting limits, Respirable Crystalline Silica is reported as less than the lowest polymorph reporting limit concentration.

These results apply to the sample(s) as received. The analysis has been conducted according to the method(s) listed above. Blank corrections are not applied to data unless requested by the customer. This report is for the exclusive use of the addressed customer and shall not be reproduced, except in full, without written approval of Eurofins J3 Resources, Inc. (J3). Unless otherwise noted, all quality control samples performed within specifications established by the laboratory. J3 is not responsible for reported results that are dependent on volumes provided by non-laboratory personnel. Samples exceeding the method dust loading limit of 2 mg/filter are fractionated to determine the total respirable crystalline silica mass and concentration. The reported Respirable Crystalline Silica value is based on recovery of polymorphs Quartz, Cristobalite, and/or Tridymite at levels greater than their respective reporting limits. The possible presence of crystalline silica polymorphs at levels less than reporting limits cannot be ruled out. When all polymorph results are below reporting limits, Respirable Crystalline Silica is reported as less than the lowest polymorph reporting limit concentration.

These results apply to the sample(s) as received. The analysis has been conducted according to the method(s) listed above. Blank corrections are not applied to data unless requested by the customer. This report is for the exclusive use of the addressed customer and shall not be reproduced, except in full, without written approval of Eurofins J3 Resources, Inc. (J3). Unless otherwise noted, all quality control samples performed within specifications established by the laboratory. J3 is not responsible for reported results that are dependent on volumes provided by non-laboratory personnel. Samples exceeding the method dust loading limit of 2 mg/filter are fractionated to determine the total respirable crystalline silica mass and concentration. The reported Respirable Crystalline Silica value is based on recovery of polymorphs Quartz, Cristobalite, and/or Tridymite at levels greater than their respective reporting limits. The possible presence of crystalline silica polymorphs at levels less than reporting limits cannot be ruled out. When all polymorph results are below reporting limits, Respirable Crystalline Silica is reported as less than the lowest polymorph reporting limit concentration.

These results apply to the sample(s) as received. The analysis has been conducted according to the method(s) listed above. Blank corrections are not applied to data unless requested by the customer. This report is for the exclusive use of the addressed customer and shall not be reproduced, except in full, without written approval of Eurofins J3 Resources, Inc. (J3). Unless otherwise noted, all quality control samples performed within specifications established by the laboratory. J3 is not responsible for reported results that are dependent on volumes provided by non-laboratory personnel. Samples exceeding the method dust loading limit of 2 mg/filter are fractionated to determine the total respirable crystalline silica mass and concentration. The reported Respirable Crystalline Silica value is based on recovery of polymorphs Quartz, Cristobalite, and/or Tridymite at levels greater than their respective reporting limits. The possible presence of crystalline silica polymorphs at levels less than reporting limits cannot be ruled out. When all polymorph results are below reporting limits, Respirable Crystalline Silica is reported as less than the lowest polymorph reporting limit concentration.

These results apply to the sample(s) as received. The analysis has been conducted according to the method(s) listed above. Blank corrections are not applied to data unless requested by the customer. This report is for the exclusive use of the addressed customer and shall not be reproduced, except in full, without written approval of Eurofins J3 Resources, Inc. (J3). Unless otherwise noted, all quality control samples performed within specifications established by the laboratory. J3 is not responsible for reported results that are dependent on volumes provided by non-laboratory personnel. Samples exceeding the method dust loading limit of 2 mg/filter are fractionated to determine the total respirable crystalline silica mass and concentration. The reported Respirable Crystalline Silica value is based on recovery of polymorphs Quartz, Cristobalite, and/or Tridymite at levels greater than their respective reporting limits. The possible presence of crystalline silica polymorphs at levels less than reporting limits cannot be ruled out. When all polymorph results are below reporting limits, Respirable Crystalline Silica is reported as less than the lowest polymorph reporting limit concentration.

These results apply to the sample(s) as received. The analysis has been conducted according to the method(s) listed above. Blank corrections are not applied to data unless requested by the customer. This report is for the exclusive use of the addressed customer and shall not be reproduced, except in full, without written approval of Eurofins J3 Resources, Inc. (J3). Unless otherwise noted, all quality control samples performed within specifications established by the laboratory. J3 is not responsible for reported results that are dependent on volumes provided by non-laboratory personnel. Samples exceeding the method dust loading limit of 2 mg/filter are fractionated to determine the total respirable crystalline silica mass and concentration. The reported Respirable Crystalline Silica value is based on recovery of polymorphs Quartz, Cristobalite, and/or Tridymite at levels greater than their respective reporting limits. The possible presence of crystalline silica polymorphs at levels less than reporting limits cannot be ruled out. When all polymorph results are below reporting limits, Respirable Crystalline Silica is reported as less than the lowest polymorph reporting limit concentration.

These results apply to the sample(s) as received. The analysis has been conducted according to the method(s) listed above. Blank corrections are not applied to data unless requested by the customer. This report is for the exclusive use of the addressed customer and shall not be reproduced, except in full, without written approval of Eurofins J3 Resources, Inc. (J3). Unless otherwise noted, all quality control samples performed within specifications established by the laboratory. J3 is not responsible for reported results that are dependent on volumes provided by non-laboratory personnel. Samples exceeding the method dust loading limit of 2 mg/filter are fractionated to determine the total respirable crystalline silica mass and concentration. The reported Respirable Crystalline Silica value is based on recovery of polymorphs Quartz, Cristobalite, and/or Tridymite at levels greater than their respective reporting limits. The possible presence of crystalline silica polymorphs at levels less than reporting limits cannot be ruled out. When all polymorph results are below reporting limits, Respirable Crystalline Silica is reported as less than the lowest polymorph reporting limit concentration.

Narrative

CASE NARRATIVE

Client: FPM Remediations Inc

Project: BNL Decommissioning Project

Report Number: 160-41698-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The sample was received on 4/14/2021 9:05 AM. Unless otherwise noted below, the sample arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 2.1º C.

The sample was anlayzed for asbestos by RJ Lee. Refer to the subcaontract section of the report for notes and results of this analysis.

PERCENT SOLIDS
Sample BF-03-041321 (160-41698-1) was analyzed for percent solids in accordance with EPA Method 160.3 MOD. The samples were analyzed on 04/14/2021 and 04/15/2021.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

STRONTIUM-90 (GFPC)
Sample BF-03-041321 (160-41698-1) was analyzed for Strontium-90 (GFPC) in accordance with EPA 905. The samples were leached on 04/14/2021, prepared on 04/28/2021 and analyzed on 05/07/2021.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

RADIUM-226 BY GAMMA SPEC (21 DAY INGROWTH)
Sample BF-03-041321 (160-41698-1) was analyzed for Radium-226 by gamma spec (21 day ingrowth) in accordance with EPA GA_01_R. The samples were leached on 04/14/2021, prepared on 04/16/2021 and analyzed on 05/07/2021.

Preparation Batch 160-505916:
For samples BF-03-041321 (160-41698-1), (LCS 160-505916/2-A), (MB 160-505916/1-A), (820-457-B-1-A), and (820-457-B-1-B DU) many isotopes requested for analysis do not have any gamma emissions, or the gamma emissions they do have are very poor. Often, such analytes are reported by gamma spectrometry assuming secular equilibrium with a longer-lived parent. The client should ensure that such inference is acceptable for their sample based upon process knowledge. The following assumptions were made for this report:

DISCLAIMER NOTES

· "ND" indicates no asbestos was detected; the method detection limit is 0.25%.
· "Trace" or "<" indicates asbestos was identified in the sample, but the concentration is less than the method quantitation limit. PLM coefficients of variance range from approximately 1.8 at the quantitation limit of 0.25% to 0.32 at high fiber concentrations.
· Samples are archived for three months following analysis and are then properly discarded.
· These results are submitted pursuant to RJ Lee Group's current terms and conditions of sale, including the company's standard warranty and limitation of liability provisions. No responsibility or liability is assumed for the manner in which these results are used or interpreted.
· This test report relates to the items tested.
· This report is not valid unless it bears the name of a NVLAP Lab Code 101208-0 approved signatory.
· Any reproduction of this document must be in full in order for the report to be valid.
· This report may not be used to claim product endorsement by NVLAP Lab Code 101208-0, any agency of the U.S. Government or any other laboratory accrediting agency.
· Polarized-light microscopy is not consistently reliable in detecting asbestos in floor coverings and similar nonfriable organically bound materials. Quantitative transmission electron microscopy is currently the only method that can be used to determine if this material can be considered or treated as "non-asbestos-containing."
· Sample(s) for this project were analyzed at our: Monroeville, PA (AIHA LAP, LLC. #100364, NY ELAP #10884) facility.
· If RJ Lee Group, Inc. did not collect the samples analyzed, the verifiability of the laboratorys results are limited to the reported values.

Narrative

CASE NARRATIVE

Client: FPM Remediations Inc

Project: BNL Decommissioning Project

Report Number: 160-41798-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The sample was received on 4/22/2021 9:00 AM. Unless otherwise noted below, the sample arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 2.8º C.

RADIUM-226 BY GAMMA SPEC (21 DAY INGROWTH)
Sample BF-04-042121 (160-41798-1) was analyzed for Radium-226 by gamma spec (21 day ingrowth) in accordance with EPA GA_01_R. The samples were leached on 04/23/2021, prepared on 04/29/2021 and analyzed on 05/20/2021.

Preparation Batch 160-507694:
The relative percent difference (RPD) and replicate error ratio (RER) is outside of the acceptance limits of 40%/1 for Co-60 (217%/1.76). Both the sample and duplicate activity were less than the MDC: (160-41814-A-4-C DU).

The method blank (MB) z-score is within limits and is stored in the level IV raw data: (MB 160-507694/1-A).

For samples BF-04-042121 (160-41798-1), (LCS 160-507694/2-A), (MB 160-507694/1-A), (160-41814-A-4-B), and (160-41814-A-4-C DU) many isotopes requested for analysis do not have any gamma emissions, or the gamma emissions they do have are very poor. Often, such analytes are reported by gamma spectrometry assuming secular equilibrium with a longer-lived parent. The client should ensure that such inference is acceptable for their sample based upon process knowledge. The following assumptions were made for this report:

Narrative

CASE NARRATIVE

Client: FPM Remediations Inc

Project: BNL Decommissioning Project

Report Number: 160-42005-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The samples were received on 5/11/2021 9:10 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 2.8º C.

Laboratory: Eurofins TestAmerica, St. Louis (Continued)

The sample was analyzed for asbestos by RJ Lee. Refer to the subcontract section of the report for notes and results of this analysis.

PERCENT SOLIDS

Samples BF-05-051021 (160-42005-1) and BF-06-051021 (160-42005-2) were analyzed for percent solids in accordance with EPA Method 160.3 MOD. The samples were analyzed on 05/11/2021.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

STRONTIUM-90 (GFPC)

Samples BF-05-051021 (160-42005-1) and BF-06-051021 (160-42005-2) were analyzed for Strontium-90 (GFPC) in accordance with EPA 905. The samples were leached on 05/11/2021, prepared on 05/27/2021 and analyzed on 06/09/2021.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

RADIUM-226 BY GAMMA SPEC (21 DAY INGROWTH)

Samples BF-05-051021 (160-42005-1) and BF-06-051021 (160-42005-2) were analyzed for Radium-226 by gamma spec (21 day ingrowth) in accordance with EPA GA_01_R. The samples were leached on 05/11/2021, prepared on 05/13/2021 and analyzed on 06/03/2021.

Preparation Batch 160-509473:
For samples BF-05-051021 (160-42005-1), BF-06-051021 (160-42005-2), (LCS 160-509473/2-A), (MB 160-509473/1-A), (160-42040-A-1-A), and (160-42040-A-1-B DU) many isotopes requested for analysis do not have any gamma emissions, or the gamma emissions they do have are very poor. Often, such analytes are reported by gamma spectrometry assuming secular equilibrium with a longer-lived parent. The client should ensure that such inference is acceptable for their sample based upon process knowledge. The following assumptions were made for this report:

Th-234	Pa-234
Th-234	U-238
Pb-210	Po-210
Pb-210	Bi-210

DISCLAIMER NOTES

· "ND" indicates no asbestos was detected; the method detection limit is 0.25%.
· "Trace" or "<" indicates asbestos was identified in the sample, but the concentration is less than the method quantitation limit. PLM coefficients of variance range from approximately 1.8 at the quantitation limit of 0.25% to 0.32 at high fiber concentrations.
· Samples are archived for three months following analysis and are then properly discarded.
· These results are submitted pursuant to RJ Lee Group's current terms and conditions of sale, including the company's standard warranty and limitation of liability provisions. No responsibility or liability is assumed for the manner in which these results are used or interpreted.
· This test report relates to the items tested.
· This report is not valid unless it bears the name of a NVLAP Lab Code 101208-0 approved signatory.
· Any reproduction of this document must be in full in order for the report to be valid.
· This report may not be used to claim product endorsement by NVLAP Lab Code 101208-0, any agency of the U.S. Government or any other laboratory accrediting agency.
· Polarized-light microscopy is not consistently reliable in detecting asbestos in floor coverings and similar nonfriable organically bound materials. Quantitative transmission electron microscopy is currently the only method that can be used to determine if this material can be considered or treated as "non-asbestos-containing."
· Sample(s) for this project were analyzed at our: Monroeville, PA (AIHA LAP, LLC. #100364, NY ELAP #10884) facility.
· If RJ Lee Group, Inc. did not collect the samples analyzed, the verifiability of the laboratorys results are limited to the reported values.

Narrative

CASE NARRATIVE

Client: FPM Remediations Inc

Project: BNL Decommissioning Project

Report Number: 160-42457-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The sample was received on 6/17/2021 9:20 AM. Unless otherwise noted below, the sample arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 9.7º C.

Asbestos

Job ID: 160-42457-1 (Continued)

Laboratory: Eurofins TestAmerica, St. Louis (Continued)

The sample was forwarded to RJ LEE for asbestos analysis. Refer to the subcontract section of the report for notes regarding this analysis.

STRONTIUM-90 (GFPC)
Sample BF-07-061621 (160-42457-1) was analyzed for Strontium-90 (GFPC) in accordance with EPA 905. The samples were leached on 06/18/2021, prepared on 07/15/2021 and analyzed on 07/27/2021.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

RADIUM-226 BY GAMMA SPEC (21 DAY INGROWTH)
Sample BF-07-061621 (160-42457-1) was analyzed for Radium-226 by gamma spec (21 day ingrowth) in accordance with EPA GA_01_R. The samples were leached on 06/18/2021, prepared on 06/22/2021 and analyzed on 07/14/2021.

Preparation Batch 160-515451:
The following samples could not be thoroughly homogenized before sub-sampling was performed due to the sample matrix. The sample contained small rocks: BF-07-061621 (160-42457-1) and (160-42457-A-1-A DU).

The detection goal of 0.200 pCi/L was not met for Ra-226. An elevated MDC can occur when higher background counts are applied to a peak ROI. This is due to the relatively small size of the peak or subsequent “force-fit” of the non-existent peak which resulted in higher than normal background counts due to statistical fluctuations in the Compton background. The laboratory does not believe this adversely affects the data, the Ra-226 is well below the RL and MDC: (190-26213-A-1-A) and (190-26213-A-1-C DU).

For samples BF-07-061621 (160-42457-1), (LCS 160-515451/2-A), (MB 160-515451/1-A), (190-26213-A-1-A), and (190-26213-A-1-C DU) many isotopes requested for analysis do not have any gamma emissions, or the gamma emissions they do have are very poor. Often, such analytes are reported by gamma spectrometry assuming secular equilibrium with a longer-lived parent. The client should ensure that such inference is acceptable for their sample based upon process knowledge. The following assumptions were made for this report:

Inferred From Nuclide	Reported to Nuclide
Th-234	Pa-234
Th-234	U-238
Pb-210	Po-210
Pb-210	Bi-210

Po-216	Pb-212
Xe-131m	Xe-131
Sb-125	Te-125m
Ag-108m	Ag-108
Rh-106	Ru-106
Pb-212	Th-228
Pb-212	Ra-224

Th-227	Ra-223
Th-227	Ac-227
Th-227	Bi-214
Th-227	Pb-211
Bi-214	Ra-226

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

DISCLAIMER NOTES

· "ND" indicates no asbestos was detected; the method detection limit is 0.25%.
· "Trace" or "<" indicates asbestos was identified in the sample, but the concentration is less than the method quantitation limit. PLM coefficients of variance range from approximately 1.8 at the quantitation limit of 0.25% to 0.32 at high fiber concentrations.
· Samples are archived for three months following analysis and are then properly discarded.
· These results are submitted pursuant to RJ Lee Group's current terms and conditions of sale, including the company's standard warranty and limitation of liability provisions. No responsibility or liability is assumed for the manner in which these results are used or interpreted.
· This test report relates to the items tested.
· This report is not valid unless it bears the name of a NVLAP Lab Code 101208-0 approved signatory.
· Any reproduction of this document must be in full in order for the report to be valid.
· This report may not be used to claim product endorsement by NVLAP Lab Code 101208-0, any agency of the U.S. Government or any other laboratory accrediting agency.
· Polarized-light microscopy is not consistently reliable in detecting asbestos in floor coverings and similar nonfriable organically bound materials. Quantitative transmission electron microscopy is currently the only method that can be used to determine if this material can be considered or treated as "non-asbestos-containing."
· Sample(s) for this project were analyzed at our: Monroeville, PA (AIHA LAP, LLC. #100364, NY ELAP #10884) facility.
· If RJ Lee Group, Inc. did not collect the samples analyzed, the verifiability of the laboratorys results are limited to the reported values.

Narrative

CASE NARRATIVE

Client: FPM Remediations Inc

Project: BNL Decommissioning Project

Report Number: 160-42457-2

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The sample was received on 6/17/2021 9:20 AM. Unless otherwise noted below, the sample arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 9.7º C.

Narrative

CASE NARRATIVE

Client: FPM Remediations Inc

Project: BNL Decommissioning Project

Report Number: 160-41698-2

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The sample was received on 4/14/2021 9:05 AM. Unless otherwise noted below, the sample arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 2.1º C.

METALS ICP/MS

Sample BF-03-041321 (160-41698-1) was analyzed for Metals ICP/MS in accordance with SW 846. The samples were prepared and analyzed on 05/10/2021.

Job ID: 160-41698-2 (Continued)

Narrative

CASE NARRATIVE

Client: FPM Remediations Inc

Project: BNL Decommissioning Project

Report Number: 160-42005-2

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The samples were received on 5/11/2021 9:10 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 2.8º C.

METALS ICP/MS

Samples BF-05-051021 (160-42005-1) and BF-06-051021 (160-42005-2) were analyzed for Metals ICP/MS in accordance with SW 846. The samples were prepared on 06/06/2021 and analyzed on 06/07/2021.

Introduction

This subject area describes how Brookhaven National Laboratory (BNL) staff and non-BNL staff who use conveyances to transport material that has the potential to be radioactively contaminated or activated to off-site locations, or perform on-site transfers of scrap metals, electronics, and Construction-Demolition (C&D) debris, must use the vehicle radiation monitor (VRM) as a final check before proceeding to their final destination.

The VRM at BNL is a series of permanently placed gamma radiation detectors that are operating in a static mode. This unit has the capability to differentiate between radioactivity added and natural background radiation. It also has real-time video and picture-taking capabilities. It offers a two dimensional view of the conveyance to aid the responding Facility Support (FS) personnel in locating the proximity of the radioactive material alarm.

This system operates as a "go/no go" unit, it is not intended to replace or be used in lieu of a radiological survey. Prior to going through the VRM, all suspect material leaving a Radiological Area must be surveyed and documented by FS personnel in accordance with 10 CFR 835 and DOE O 458.1.

The driver must follow the posted instructions at the VRM prior to proceeding through. If a driver is unsure how to properly use the VRM, they should contact FS personnel for assistance.

This subject area contains the following sections:

1. Delivery of Material to the Clean Scrap Metal Yard
2. Pickup of Clean Scrap Metal by Outside Vendor
3. Disposition of Salvage Material and Excess Warehouse Material
4. Release of Municipal Solid Waste/Industrial Waste Off-site.

This subject area does not cover the following:

This subject area does not apply to delivery trucks/conveyances such as, but not limited to, trucks delivering supplies and materials to BNL, United States Postal Service, United Parcel Service, DHL, FedEx, food delivery trucks, etc. This subject area also does not apply to radioactive waste shipments.

Procedure:

1. Delivery of Material to the Clean Scrap Metal Yard

Required Procedure

Applicability

This section applies to BNL and non-BNL delivery of material to the Clean Scrap Yard. This section is also applicable to outside vendors who pick up Clean Scrap Metal for off-site disposition.

Required Procedure

1. Prior to pick up, a Process Knowledge Form (PKF) for Clean and Suspension Encumbered Metals from the Management of Moratorium and Suspension Encumbered Metals Subject Area for material must be completed.
2. Proceed to the vehicle radiation monitor (VRM) for final survey. Read the posted Instructions prior to going through the VRM. If you do not understand the Instructions, call Facility Support (FS) personnel for assistance. **Do not proceed.**
3. Upon going through the VRM, you will either see a green light indicating a successful pass or you will see a red indication light with an audible alarm, this indicates an unsuccessful pass. For the successful pass, you will then be prompted to take a "clean" ticket. For the unsuccessful pass, you are required to notify FS personnel. **Do not leave the area.**
4. If the VRM is out of service, contact FS personnel for final survey and a clean survey form.
5. With a "clean" ticket in hand, proceed to the Scrap Yard.
6. At the Scrap Yard, you will hand Procurement & Property Management (PPM) personnel the completed PKF and the "clean" VRM ticket or a VRM Clean Survey Form.

3. After passing through the VRM you will receive one of two indications, a "green" light indicates a clean passage, if this occurs, continue to the next step. If you receive a "red" light, this indicates a failed passage; you will also get an audible alarm. In this case contact FS personnel. **Do not leave the VRM area.**
4. If the VRM is out of service, contact FS personnel for initial survey of empty container(s) and obtain a VRM Clean Survey Form.
5. Proceed to the Weigh Station for weight of empty container(s).
6. Proceed to Clean Scrap Metal Yard.
7. Hand over the “clean” VRM ticket or VRM Clean Survey Form and the scale ticket to PPM personnel.
8. PPM personnel will load container(s) with Clean Scrap Metal.
9. Proceed to VRM for final survey.
10. After passing through the VRM you will receive one of two indications, a "green" light indicates a clean passage, if this occurs, continue to the Main Gate to exit the Lab property. If you receive a "red" light, this

indicates a failed passage; you will also get an audible alarm. In this case contact FS personnel. **Do not leave the VRM area.**

11. If the VRM is out of service, contact FS personnel for the survey of the full container(s) and obtain a VRM Clean Survey Form.

Volatile Analysis Sample Containers

Lab ID	Client Sample ID	Volatile Sample Container

21H0697-04	S-2 Voc	2 oz. WM Clear Glass Cool to 4° C

Sample and Data Qualifiers Relating to This Work Order

VOA-CONT	Non-Compliant - the container(s) provided by the client for soil volatiles do not meet the requirements of EPA SW846-5035A. Results reported below 200 ug/kg may be biased low due to samples not being collected according to EPA SW846 5035A requirements.
S-GC	Two surrogates are used for this analysis. One surrogate recovered within control limits therefore the analysis is acceptable.
S-08	The recovery of this surrogate was outside of QC limits.
S-04	The surrogate recovery for this sample is outside of established control limits due to a sample matrix effect.
QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
QC-LCS	LCS/LCS Dup recovery was above laboratory control limits. Sample does not contain any target compounds; therefore sample results are acceptable.
M-SPKM	The spike recovery is not within acceptance windows due to sample non-homogeneity, or matrix interference.
M-DUPS	The RPD between the native sample and the duplicate is outside of limits due to sample non-homogeneity
M-CRL	The RL check for this element recovered outside of control limits.
J	Detected below the Reporting Limit but greater than or equal to the Method Detection Limit (MDL/LOD) or in the case of a TIC, the result is an estimated concentration.
CCV-H	The value reported is estimated due to its behavior during continuing calibration verification (>20% difference for average RF or >20% drift for linear or quadratic fit.) This value may be biased high.
CCV-E	The value reported is ESTIMATED. The value is estimated due to its behavior during continuing calibration verification (>20% Difference for average Rf or >20% Drift for quadratic fit).

Definitions and Other Explanations

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence. This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

High Bias — High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

Non-Dir. — Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Narrative

CASE NARRATIVE

Client: FPM Remediations Inc

Project: BNL Decommissioning Project

Report Number: 160-42911-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. Surrogates are added during the extraction process prior to dilution. When the sample dilution is 5X or greater, surrogate recoveries are diluted out and no corrective action is required.

Preparation Batch 460-793704, Analytical Batch 460-794019:
The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) recovered outside control limits for 2,4-D. This analyte was biased high in the LCS and LCSD and was not detected in the associated samples; therefore, the data was reported.

The %RPD between the primary and confirmation columns exceeded 40% for alpha-Chlordane. The lower value was reported and qualified in accordance with the laboratory's SOP: BF-08-072721 (160-42911-1).

The presence of the '4' qualifier indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Preparation Batch 320-511475, Analytical Batch 320-511961:
The "I" qualifier means the transition mass ratio for the indicated analyte was outside of the established ratio limit. The qualitative identification of the analyte has some degree of uncertainty, and the reported value may have some high bias. However, analyst judgment was used to positively identify the analyte: BF-08-072721 (160-42911-1).

The matrix spike / matrix spike duplicate (MS/MSD) recoveries for several target analytes were outside control limits. Sample matrix interference and/or non-homogeneity are suspected.

The matrix spike/matrix spike duplicate (MS/MSD) precision for Perfluoroheptanesulfonic Acid (PFHpS) was outside control limits. Sample matrix interference is suspected.

The transition mass ion ratio was outside of the established limits for Perfluorohexanoic acid (PFHxA) in (CCVL 320-512178/2) as indicated by the "I" flag in the raw data. The analyte was in control in the CCV; therefore, the data was reported.

The transition mass ion ratio was outside of the established limits for Perfluorohexanoic acid (PFHxA) in (CCVL 320-511877/2) as indicated by the "I" flag in the raw data. The analyte was in in control in the CCV; therefore, the data was reported.

Preparation Batch 320-511475, Analytical Batch 320-512253:
Due to the high concentration of Perfluorohexanesulfonic acid (PFHxS) and Perfluorooctanesulfonic acid (PFOS), the matrix spike / matrix spike duplicate (MS/MSD) could not be evaluated for accuracy and precision. The associated laboratory control sample (LCS) met acceptance criteria.

Results for samples (320-76807-A-2-A), (320-76807-A-2-B MS), and (320-76807-A-2-C MSD) were reported from the analysis of a diluted extract due to high concentration of the target analyte in the analysis of the undiluted extract. The dilution factor was applied to the labeled internal standard area counts and these area counts were within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Note (1): Whenever State or Federal discharge limits are more stringent than County discharge limits, the appropriate State or Federal limit shall prevail.

Note (2): Daily average concentration value shall be determined by analysis of one (1) or more grab samples obtained within a 24 hour period divided by the number of sample values obtained over that 24 hour period OR a time or flow proportional composite sample obtained over a 24 hour period.

Note (3): Monthly average concentration value shall be calculated as the sum of daily average concentration values recorded over a calendar month, divided by the number of daily average sample values obtained over that calendar month.

Note (4): In accordance with Standard Methods for the Examination of Water and Wastewater latest edition - Method 412B (Total) and 412F (Amenable).

Note (5): These values may be multiplied by a factor of 1.5, if the municipal water supply is not fluoridated.

Note (6): Total Toxic Organics is defined below.

Note (7): Individual Toxic Organic Compounds are specified on page 3.

Note (8): Compatible wastes in excess of the **listed** concentration levels may be acceptable and will be subject to excess strength surcharge billing in all sewer districts, with the exception of **Sewer District 18 – "Hauppauge"** wherein an excess strength surcharge shall apply to BOD_5 levels over 1,000 mg/L, and to Suspended Solids levels over 750 mg/L.; and also with the exception of **Sewer District 7P -"Twelve Pines"** wherein a maximum sewer discharge limit of 250 mg/L applies to BOD_5.

DEFINITIONS:

TOTAL TOXIC ORGANICS (TTO)

1) The term "TTO" shall mean total toxic organics, which is the summation of all quantifiable values greater than 0.01 milligrams per liter for the toxic organics listed on pages 3 and 4.

2) Monitoring:

   A) In lieu of monitoring for total toxic organics (TTO), the Administrator may allow industrial users to make the following certification as a comment on any periodic reports required: "Based on my inquiry of the person or persons directly responsible for managing compliance with the pretreatment standard for TTO I certify that to the best of my knowledge and belief no discharge of toxic organics into the wastewaters has occurred since filing the last discharge monitoring report. I further certify that this facility is implementing the solvent management plan submitted to the Administrator".

   B) Industrial users may be required to submit a solvent management plan that specifies to the Administrator's satisfaction the toxic organic compounds used, the method of disposal used, and the procedures for assuring that toxic organics do not routinely spill or leak into the wastewater discharged to the County sewage works.

Individual compounds in each group shall be limited as follows:

Volatile Organic Compounds:.....2.5 mg/L
Acid Extractable Compounds:.....1.5 mg/L
Base Neutral Extractable Compounds:.....1.5 mg/L
Pesticides and PCB's:.....1.0 mg/L

Narrative

CASE NARRATIVE

Client: ICC Commonwealth Corp

Project: BNL Wastewater

Report Number: 160-40134-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The samples were received on 10/28/2020 9:00 AM; the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 17.5º C.

Receipt Exceptions

Job ID: 160-40134-1 (Continued)

Laboratory: Eurofins TestAmerica, St. Louis (Continued)

One or more containers for the following sample was received broken: FWTC-11 (160-40134-6).

One or more containers for the following sample was received empty with the cap off: BTGS (160-40134-3).

The following sample was listed on the Chain of Custody (COC); however, no sample was received: BTTC (160-40134-5).

GROSS ALPHA AND GROSS BETA RADIOACTIVITY

Samples BTGA/GB (160-40134-1) and FW/GA/GB-11 (160-40134-2) were analyzed for Gross Alpha and Gross Beta Radioactivity in accordance with USEPA Method 900.0. The samples were prepared on 11/12/2020 and analyzed on 11/28/2020 and 12/09/2020.

Preparation Batch 160-488958:
The gross alpha and/or gross beta detection goal was not met for the following samples due to a reduction of the sample size attributed to high residual mass. Analytical results are reported with the detection limit achieved: BTGA/GB (160-40134-1) and FW/GA/GB-11 (160-40134-2).

The daily check was outside the criteria on 11/28/20 for detector 23. For both the previous and following days (11/27 and 11/28) the daily check passed for the affected detector; therefore, the results were reported: (590-14121-B-1-A).

The following sample was counted on a detector that inadvertently had the alpha daily check counted under the beta daily check protocol. The detector passed when the correct beta source was counted. Therefore, the lab does not believe this excursion adversely affects the data: FW/GA/GB-11 (160-40134-2).

The gross alpha and/or beta detection goals were not met for the following sample due to a reduction of the sample size attributed to high residual mass. Analytical results are reported with the MDC achieved: BTGA/GB (160-40134-1).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

CESIUM 137 AND OTHER GAMMA EMITTERS (GS)

Sample FWGS-11 (160-40134-4) was analyzed for Cesium 137 and Other Gamma Emitters (GS) in accordance with USEPA Method 901.1. The samples were prepared on 11/10/2020 and analyzed on 11/19/2020.

Preparation Batch 160-488765:
The detection goal of 20 pCi/L was not met for Cs-137 for the following sample. An elevated MDC can occur when higher background counts are applied to a peak ROI. This is due to the relatively small size of the peak or subsequent “force-fit” of the non-existent peak which resulted in higher than normal background counts due to statistical fluctuations in the Compton baseline. The laboratory does not believe this adversely affects the data, as the peak was not found by the software and the result is well below the RL: (MB 160-488765/1-A).

For samples FWGS-11 (160-40134-4) and (160-40134-A-4-B DU) many isotopes requested for analysis do not have any gamma emissions, or the gamma emissions they do have are very poor. Often, such analytes are reported by gamma spectrometry assuming secular equilibrium with a longer-lived parent. The client should ensure that such inference is acceptable for their sample based upon process knowledge. The following assumptions were made for this report:

Inferred From Nuclide	Reported to Nuclide
Th-234	Pa-234
Th-234	U-238

Narrative

CASE NARRATIVE

Client: ICC Commonwealth Corp

Project: BNL Wastewater

Report Number: 160-40891-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The samples were received on 12/23/2020 9:02 AM; the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 14.5º C.

Receipt Exceptions

Job ID: 160-40891-1 (Continued)

Laboratory: Eurofins TestAmerica, St. Louis (Continued)

The following samples were received with insufficient preservation. The client was contacted, and the laboratory was instructed to adjust the pH and proceed with analysis. 6mL of HNO3 preservative was added by the laboratory, and the sample pHs were adjusted to less than 2 SU: FIRE HYDRANT-1 (160-40891-1), TANK-1102-1 (160-40891-2) and TANK-1102-2 (160-40891-4).

GROSS ALPHA AND GROSS BETA RADIOACTIVITY

Samples FIRE HYDRANT-1 (160-40891-1) and TANK-1102-1 (160-40891-2) were analyzed for Gross Alpha and Gross Beta Radioactivity in accordance with USEPA Method 900.0. The samples were prepared on 12/31/2020 and analyzed on 01/06/2021.

Preparation Batch 160-493663:
The gross alpha and/or beta detection goals were not met for the following samples due to a reduction of the sample size attributed to high residual mass. Analytical results were reported with the MDC achieved: TANK-1102-1 (160-40891-2), (160-40760-I-1-D), (160-40760-I-1-E MS), (160-40760-I-1-G MSBT), (160-40760-I-1-H MSBTD), and (160-40760-I-1-F MSD).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

CESIUM 137 AND OTHER GAMMA EMITTERS (GS)

Samples FIRE HYDRANT-2 (160-40891-3) and TANK-1102-2 (160-40891-4) were analyzed for Cesium 137 and Other Gamma Emitters (GS) in accordance with USEPA Method 901.1. The samples were prepared on 12/28/2020 and analyzed on 12/30/2020.

Preparation Batch 160-493166:
The detection goal of 20 pCi/L was not met for Cs-137 for the following sample. An elevated MDC can occur when higher background counts are applied to a peak ROI. This is due to the relatively small size of the peak or subsequent “force-fit” of the non-existent peak which resulted in higher than normal background counts due to statistical fluctuations in the Compton backgrounds. The laboratory does not believe this adversely affects the data. The Cs-137 is well below the RL and MDC: FIRE HYDRANT-2 (160-40891-3) and TANK-1102-2 (160-40891-4).

For samples FIRE HYDRANT-2 (160-40891-3), TANK-1102-2 (160-40891-4) and (160-40891-A-4-B DU) many isotopes requested for analysis do not have any gamma emissions, or the gamma emissions they do have are very poor. Often, such analytes are reported by gamma spectrometry assuming secular equilibrium with a longer-lived parent. The client should ensure that such inference is acceptable for their sample based upon process knowledge. The following assumptions were made for this report:

Inferred From Nuclide	Reported to Nuclide
Th-234	Pa-234
Th-234	U-238
Pb-210	Po-210
Pb-210	Bi-210

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TRITIUM, TOTAL (LSC)

Samples FIRE HYDRANT-3 (160-40891-5) and TANK-1102-3 (160-40891-6) were analyzed for Tritium, Total (LSC) in accordance with USEPA 906.0. The samples were prepared on 01/11/2021 and analyzed on 01/12/2021.

Preparation Batch 160-494541:
Due to gaseous smells, antifoam was added to the following samples: TANK-1102-3 (160-40891-6).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

CARBON-14 BY LSC

Samples FIRE HYDRANT-3 (160-40891-5) and TANK-1102-3 (160-40891-6) were analyzed for Carbon-14 by LSC in accordance with EERF. The samples were prepared on 01/06/2021 and analyzed on 01/07/2021.

Preparation Batch 160-494111:
The following samples contained sediment: FIRE HYDRANT-3 (160-40891-5), TANK-1102-3 (160-40891-6), (160-40891-A-5 DU), and (160-40891-A-6 MS). 45 mL of C-14 cocktail was added to the samples because they were suspected to be high in organic matter. Samples 160-40891-6 and 6 MS had a dark black color and were malodorous.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Narrative

CASE NARRATIVE

Client: FPM Remediations Inc

Project: BNL Decommissioning Project

Report Number: 160-41392-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The samples were received on 3/5/2021 12:14 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were -1.7º C and 1.9º C.

POLYCHLORINATED BIPHENYLS (PCBS) BY GAS CHROMATOGRAPHY

Sample WC-001-030421 (160-41392-1) was analyzed for Polychlorinated Biphenyls (PCBs) by Gas Chromatography in accordance with EPA SW-846 Method 8082_DOD5. The samples were prepared on 03/10/2021 and analyzed on 03/17/2021.

The presence of the '4' qualifier indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Preparation Batch 280-528680, Analytical Batch 280-529203:
The following samples required a sulfuric acid clean-up, via EPA Method 3665A, to reduce matrix interferences: WC-001-030421 (160-41392-1), (280-146124-A-1-A), (280-146124-A-1-B MS) and (280-146124-A-1-C MSD).

The closing continuous calibration verification (CCV) recovered below lower control limits for DCB Decachlorobiphenyl and PCB-1260 on the primary column, and recovered above upper control limits for DCB Decachlorobiphenyl on the confirmation column. The opening CCV recovered within control limits. Results for PCB-1260 from the associated CCV were either non-detect or not reported from this batch: (280-146124-A-1-A), (280-146124-A-1-B MS), and (280-146124-A-1-C MSD).

The following samples were diluted to bring the concentration of target analytes within the calibration range. Elevated reporting limits (RLs) were provided: (280-146124-A-1-A), (280-146124-A-1-B MS), and (280-146124-A-1-C MSD).

Preparation Batch 280-528680, Analytical Batch 280-529378:
The following sample was diluted due to dark color and viscous nature of sample matrix. Elevated reporting limits (RL) were provided: WC-001-030421 (160-41392-1).

The matrix spike / matrix spike duplicate recoveries were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits: (280-146124-A-1-A), (280-146124-A-1-B MS), and (280-146124-A-1-C MSD) .

Surrogate DCB Decachlorobiphenyl recovered outside the lower control limit at at 28% (59%). Surrogate Tetrachloro-m-xylene met acceptance criteria. Evidence of matrix interference was present; therefore, re-extraction and/or re-analysis was not performed: WC-001-030421 (160-41392-1).

The following samples required a dilution due to the nature of the sample matrix. Because of this dilution, the surrogate spike concentration in the sample was reduced to a level where the recovery calculation does not provide useful information: (280-146124-A-1-B MS) and (280-146124-A-1-C MSD).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TCLP METALS (ICP)

Sample WC-001-030421 (160-41392-1) was analyzed for TCLP metals (ICP) in accordance with EPA SW-846 Method 1311/6010C_DoD5. The samples were leached on 03/10/2021, prepared on 03/18/2021 and analyzed on 03/20/2021.

METALS (ICP/MS)

Sample WC-001-030421 (160-41392-1) was analyzed for Metals (ICP/MS) in accordance with EPA SW-846 Method 6020A. The samples were prepared on 03/18/2021 and analyzed on 03/24/2021.

For ICPMS Metals, a 2X dilution was performed. This is a standard dilution that is performed by TestAmerica St. Louis on all samples analyzed by method SW-846 6020A. The dilution is performed in order to have the matrix of the samples (i.e. the concentration of acids) match the matrix of the standards used for calibration and instrument quality control purposes. The MDL studies analyzed by this method undergo the same 2X dilution, and all detection limits are based on this. Therefore, MDL's and RL's are not affected by the dilution.

RADIUM-226 BY GAMMA SPEC (21 DAY INGROWTH)
Sample WC-001-030421 (160-41392-1) was analyzed for Radium-226 by gamma spec (21 day ingrowth) in accordance with EPA GA_01_R. The samples were leached on 03/08/2021, prepared on 03/11/2021 and analyzed on 04/01/2021.

Preparation Batch 160-501596:
The MB MDC/activity ratio for Zn-65 does not meet QC criteria. This appears to be random in nature, and limited deviations such as this are statistically expected when larger analyte lists are reported. Such excursions are often caused by fluctuations in Compton background, force-fitting of peaks that are not found by the software peak-search algorithm, and inclusion of inferior peak results by the software in weighted averages. Zn-65 was result was below the MDC in the associated sample. The laboratory SOP allows for such statistical exceedances: WC-001-030421 (160-41392-1).

For samples WC-001-030421 (160-41392-1), (LCS 160-501596/2-A), (MB 160-501596/1-A), (160-41405-A-19-B), and (160-41405-A-19-C DU) many isotopes requested for analysis do not have any gamma emissions, or the gamma emissions they do have are very poor. Often, such analytes are reported by gamma spectrometry assuming secular equilibrium with a longer-lived parent. The client should

NICKEL 59/63

Sample WC-001-030421 (160-41392-1) was analyzed for Nickel 59/63 in accordance with STL-RC-0055. The samples were leached on 03/08/2021, prepared on 04/02/2021 and analyzed on 04/08/2021.

Preparation Batch 160-504117:
The following samples could not be thoroughly homogenized before sub-sampling was performed due to sample matrices. Samples 160-41392-1 and 1 DU contained rocks. Samples 160-41496-1-18 contained detritus: WC-001-030421 (160-41392-1) and (160-41392-H-1-A DU).

The following samples contained sediment after digestion and dissolution. All of the samples, MB, and LCS were filtered through a 0.45 micron filter before column separation: WC-001-030421 (160-41392-1).

The nickel carrier recoveries were below the lower QC limit (40%). The samples exhibited matrix interferences. The sample results met the detection goal; therefore, the lab does not believe this excursion adversely affects the data: WC-001-030421 (160-41392-1) and (160-41496-D-1-O).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

PROMETHIUM-147

Sample WC-001-030421 (160-41392-1) was analyzed for Promethium-147 in accordance with ST_RC_0047. The samples were prepared on 03/15/2021 and analyzed on 03/31/2021.

Preparation Batch 160-501940:
The analysis results were based upon the sample matrix as received (i.e. wet weight): WC-001-030421 (160-41392-1) and (160-41392-J-1 DU).

The following samples could not be thoroughly homogenized before sub-sampling was performed due to the sample matrix. The samples contained small chunks of material that were not uniform size. The samples were filtered through a 0.45 micron filter before they were placed on columns. The samples were still cloudy after filtering: WC-001-030421 (160-41392-1) and (160-41392-J-1 DU).

The MDC for the following sample was above the requested limit (RL) of 1.00 (1.04). This is potentially due to the neodymium carrier recovery, which is low but well within acceptance criteria. The samples were analllyzed using an extended count time in order to minimize any potential bias a lower carrier recovery may have on the results. The sample activity is less than the MDC and RL, indicating that any potential high bias did not affect the results achieved. The detection limit was met for the sample duplicate and replicate precision was demonstrated by acceptable replicate error ratio (RER). Analytical results were reported with the detection limit achieved: WC-001-030421 (160-41392-1).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

PLUTONIUM 241

Sample WC-001-030421 (160-41392-1) was analyzed for Plutonium 241 in accordance with TAL-STL-RC-0245. The samples were prepared on 03/25/2021 and analyzed on 04/03/2021.

Plutonium-241 exceeded the RPD limit for the duplicate of sample WC-001-030421DU (160-41392-1). Refer to the QC report for details.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

A.1 Using the dose rate meter, record the highest dose rate at contact with the surface of the package.

Date/Time of Monitoring 03/09/2021

40 µR/hr

If this measurement exceeds 500 µR/hr for an exempt package, contact the RSO.

A.2 Is package damaged (crushed, dented, wet, punctured, or stained)?

☐ Yes - Complete Section B, starting at B.2 ☐ No - Complete Section C

Section B

B.1 Using the dose rate meter, record the highest dose rate at contact with the surface of the package.

Date/Time of Monitoring _____

_____ µR/hr

If this measurement exceeds;
500 µR/hr for an exempt package; or
500 µR/hr for Radioactive White I; or
50,000 µR/hr for Radioactive Yellow II; or
200,000 µR/hr for Radioactive Yellow III - Contact the RSO (or Designee) immediately.

B.2 Using a single 47mm paper swipe, wipe a 100 cm x 100cm (4in x 4in) area on three sides of the package (total 300cm^2). Using a Model 44-9 alpha-beta-gamma (α-β-γ) probe, determine the background countrate. Then place the detector over the wipe and wait until for a stable reading before recording the wipe countrate.

_____wipe cpm - _____background cpm = _____net α/β/γ cpm

Is the net α-β-γ cpm less than 200 cpm: If yes, go to Section D. Is the net α-β-γ greater than 15,000cpm: If yes, immediately STOP and contact RSO (or Designee).

B.3 Using a Model 43-89 α probe, determine the background countrate. Then place the detector over the wipe and wait for a stable reading before recording the wipe countrate.

_____ wipe cpm - _____ background cpm = _____ net α cpm

_____net α cpm ÷ 0.25 (Eff) = _____net α dpm

Is the net α dpm less than 660 dpm? If no, STOP and contact RSO (or Designee).

DISCLAIMER NOTES

· "ND" indicates no asbestos was detected; the method detection limit is 0.25%.
· "Trace" or "<" indicates asbestos was identified in the sample, but the concentration is less than the method quantitation limit. PLM coefficients of variance range from approximately 1.8 at the quantitation limit of 0.25% to 0.32 at high fiber concentrations.
· Samples are archived for three months following analysis and are then properly discarded.
· These results are submitted pursuant to RJ Lee Group's current terms and conditions of sale, including the company's standard warranty and limitation of liability provisions. No responsibility or liability is assumed for the manner in which these results are used or interpreted.
· This test report relates to the items tested.
· This report is not valid unless it bears the name of a NVLAP Lab Code 101208-0 approved signatory.
· Any reproduction of this document must be in full in order for the report to be valid.
· This report may not be used to claim product endorsement by NVLAP Lab Code 101208-0, any agency of the U.S. Government or any other laboratory accrediting agency.
· Polarized-light microscopy is not consistently reliable in detecting asbestos in floor coverings and similar nonfriable organically bound materials. Quantitative transmission electron microscopy is currently the only method that can be used to determine if this material can be considered or treated as "non-asbestos-containing."
· Sample(s) for this project were analyzed at our: Monroeville, PA (AIHA LAP, LLC. #100364, NY ELAP #10884) facility.
· If RJ Lee Group, Inc. did not collect the samples analyzed, the verifiability of the laboratorys results are limited to the reported values.

Narrative

CASE NARRATIVE

Client: FPM Remediations Inc

Project: BNL Decommissioning Project

Report Number: 160-41401-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

TCLP METALS (ICP)

Job ID: 160-41401-1 (Continued)

Laboratory: Eurofins TestAmerica, St. Louis (Continued)

Sample WC-002-030421 (160-41401-1) was analyzed for TCLP metals (ICP) in accordance with EPA SW-846 Method 1311/6010C_DoD5. The samples were leached on 03/12/2021, prepared on 03/16/2021 and analyzed on 03/17/2021.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TOTAL METALS (ICP/MS)
Sample WC-002-030421 (160-41401-1) was analyzed for total metals (ICP/MS) in accordance with 6020A. The samples were prepared on 03/10/2021 and analyzed on 03/11/2021.

For ICPMS Metals, a 2X dilution was performed. This is a standard dilution that is performed by TestAmerica St. Louis on all samples analyzed by method SW-846 6020A. The dilution is performed in order to have the matrix of the samples (i.e. the concentration of acids) match the matrix of the standards used for calibration and instrument quality control purposes. The MDL studies analyzed by this method undergo the same 2X dilution, and all detection limits are based on this. As such, MDL's and RL's are not affected by the dilution.

No analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

TCLP MERCURY
Sample WC-002-030421 (160-41401-1) was analyzed for TCLP mercury in accordance with SW-846 Method 7470 DoD5. The samples were leached on 03/12/2021, and prepared and analyzed on 03/17/2021.

The presence of the '4' qualifier indicates analytes where the concentration in the unspiked sample exceeded four times the spiking amount.

Narrative

CASE NARRATIVE

Client: FPM Remediations Inc

Project: BNL Decommissioning Project

Report Number: 160-43079-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The samples were received on 8/13/2021 8:45 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 4 coolers at receipt time were 1.5º C, 23.4º C, 23.6º C and 24.7º C.

Analytical Batch 280-549084:
Lead was detected in method blank MB 280-548182/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been flagged. If the associated sample reported a result above the MDL and/or RL, the result has been flagged.

Lead failed the recovery criteria low for the MS/MSD of sample FSS-001-081121MS/MSD (160-43079-1). Lead exceeded the RPD limit.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

The bracketing daily background, analyzed the day after the sample was analyzed, was outside the upper QC acceptance limit indicating a potential high bias. The sample analysis on that detector had activity below the MDC indicating no adverse effect from the potential bias. In addition, the daily check and background analyzed on the day of sample analysis passed as did the bracketing daily check:

The samples exhibited a negative result greater in magnitude than the 3 sigma TPU. This occurrence was evaluated and determined to be random in nature. Sporadic occurrences such as this are statistically expected: FSS-003-081121 (160-43079-3) and FSS-004-081121 (160-43079-4).

The sample was counted on detector AV126 which failed the pulser resolution check the day after (closing bracket) the sample count. However, the sample tracer resolution was well within QC limits the day of the count. The laboratory does not believe this excursion adversely affects the data: FSS-004-081121 (160-43079-4).

The sample was counted on detector AV199 which failed the pulser energy check the day after (closing bracket) the sample count. However, the sample tracer energy centroid was well within QC limits the day of the count. The laboratory does not believe this excursion adversely affects the data: FSS-007-081121 (160-43079-7).

The sample was counted on detector AV75 which failed the pulser efficiency check (low) the day after (closing bracket) the sample count. The sample pulser efficiency the day of the count as well as the tracer recovery was within QC limits the day of the count. While the lower efficiency may lead to a higher MDC, it would not affect the sample activity result (the efficiency effectively "cancels out" due to the tracer). Further, the MDC achieved is below the client requested limit. The laboratory does not believe this excursion adversely affects the data: FSS-014-081221 (160-43079-14).

The replicate precision for Pb-212 does not meet QC criteria. This appears to be random in nature, and limited deviations such as this are statistically expected when larger analyte lists are reported. Such excursions are often caused by fluctuations in Compton background, force-fitting of peaks that are not found by the software peak-search algorithm, and inclusion of inferior peak results by the software in weighted averages. Narrative

CASE NARRATIVE

Client: FPM Remediations Inc

Project: BNL Decommissioning Project

Report Number: 160-43079-2

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The samples were received on 8/13/2021 8:45 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 4 coolers at receipt time were 1.5º C, 23.4º C, 23.6º C and 24.7º C.

STRONTIUM-90 (GFPC)

Job ID: 160-43079-2 (Continued)

Laboratory: Eurofins TestAmerica, St. Louis (Continued)

Sample FSS-006-081121 (160-43079-6) was analyzed for Strontium-90 (GFPC) in accordance with EPA 905. The samples were prepared on 09/24/2021 and analyzed on 10/08/2021.

Preparation Batch 160-523700 and 160-528721:
The sample duplicate precision was outside control limits. Both the sample and duplicate results are less than the MDC; therefore, the data was not adversely affected: (160-43154-D-9-O) and (160-43154-D-9-P DU).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

CARBON-14 BY LSC
Sample FSS-006-081121 (160-43079-6) was analyzed for Carbon-14 by LSC in accordance with EERF C-01. The samples were prepared on 10/12/2021 and analyzed on 10/15/2021.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

RADIUM 226 (21 DAY INGROWTH)
Sample FSS-006-081121 (160-43079-6) was analyzed for Radium 226 (21 day ingrowth) in accordance with DOE GA-01-R. The samples were prepared on 09/23/2021 and analyzed on 10/15/2021.

Preparation Batch 160-528523:
The MB z-score for Eu-152 does not meet QC criteria. This appears to be random in nature, and limited deviations such as this are statistically expected when larger analyte lists are reported. Such excursions are often caused by fluctuations in Compton background, force-fitting of peaks that are not found by the software peak-search algorithm, and inclusion of inferior peak results by the software in weighted averages. The laboratory SOP allows for such statistical exceedances: (MB 160-528523/1-A).

For samples FSS-006-081121 (160-43079-6), (LCS 160-528523/2-A), (MB 160-528523/1-A), and (160-43079-A-6-F DU) many isotopes requested for analysis do not have any gamma emissions, or the gamma emissions they do have are very poor. Often, such analytes are reported by gamma spectrometry assuming secular equilibrium with a longer-lived parent. The client should ensure that such inference is acceptable for their sample based upon process knowledge. The following assumptions were made for this report:

Inferred From Nuclide	Reported to Nuclide
Th-234	Pa-234
Th-234	U-238
Pb-210	Po-210
Pb-210	Bi-210

Job ID: 160-43079-2 (Continued)

Laboratory: Eurofins TestAmerica, St. Louis (Continued)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

NICKEL 59/63

Sample FSS-006-081121 (160-43079-6) was analyzed for Nickel 59/63 in accordance with LSC-Nickel. The samples were prepared on 10/08/2021 and analyzed on 10/12/2021.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Narrative

CASE NARRATIVE

Client: FPM Remediations Inc

Project: BNL Decommissioning Project

Report Number: 160-43084-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Eurofins TestAmerica, St. Louis attests to the validity of the laboratory data generated by Eurofins TestAmerica facilities reported herein. All analyses performed by Eurofins TestAmerica facilities were done using established laboratory SOPs that incorporate QA/QC procedures described in the application methods. Eurofins TestAmerica's operations groups have reviewed the data for compliance with the laboratory QA/QC plan, and data have been found to be compliant with laboratory protocols unless otherwise noted below.

The test results in this report meet all NELAP requirements for parameters for which accreditation is required or available. Any exceptions to NELAP requirements are noted in this report. Pursuant to NELAP, this report may not be reproduced, except in full, without the written approval of the laboratory.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

All solid sample results for Chemistry analyses are reported on an ""as received"" basis unless otherwise indicated by the presence of a % solids value in the method header. All soil/sediment sample results for radiochemistry analyses are based upon sample as dried and disaggregated with the exception of tritium, carbon-14, and iodine-129 by gamma spectroscopy unless requested as wet weight by the client."

Any minimum detectable concentration (MDC), critical value (DLC), or Safe Drinking Water Act detection limit (SDWA DL) is sample-specific unless otherwise stated elsewhere in this narrative.

Radiochemistry sample results are reported with the count date/time applied as the Activity Reference Date.

Reference the chain of custody and condition upon receipt report for any variations on receipt conditions and temperature of samples on receipt.

Manual Integrations were performed only when necessary and are in compliance with the laboratory's standard operating procedure. Detailed information can be found in the raw data section of the level IV report.

This laboratory report is confidential and is intended for the sole use of Eurofins TestAmerica and its client.

RECEIPT

The samples were received on 8/14/2021 9:20 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 6 coolers at receipt time were 4.3º C, 11.1º C, 22.5º C, 22.9º C, 23.5º C and 23.5º C.

Receipt Exceptions
The bags for the following samples were received open and a significant amount of sample was poured into the cooler, potentially contaminating these two samples. There is sufficient sample remaining for all analyses.

ASBESTOS
An aliquot of the samples was forwarded to RJ LEE for asbestos analysis. Refer to the subcontract section of the report for details of this analysis.

The samples were leached on 08/17/2021, prepared on 08/19/2021 and analyzed on 09/11/2021 and 09/12/2021.

Preparation Batch 160-523294:
The Ra-226 MDC of 0.239 pCi/g for the method blank (MB) was above the requested limit of 0.200 pCi/g. Ra-226 activity was not observed in the MB above the MDC or RL. The MDC's for the associated samples were not less than the requested limit. The data was reported with the MDC's achieved: (MB 160-523294/1-A).

The method blank z-score for Eu-152 did not meet QC criteria. This appears to be random in nature, and limited deviations such as this are statistically expected when larger analyte lists are reported. Such excursions are often caused by fluctuations in Compton background, force-fitting of peaks that are not found by the software peak-search algorithm, and inclusion of inferior peak results by the software in weighted averages. The laboratory SOP allows for such statistical exceedances: (MB 160-523294/1-A).

The detection goal of 0.200 pCi/g was not met for Ra-226 for the samples. An elevated MDC can occur when higher background counts are applied to a peak ROI. This is due to the relatively small size of the peak or subsequent “force-fit” of the non-existent peak which resulted in higher than normal background counts due to statistical fluctuations in the Compton background. The laboratory does not believe this adversely affects the data, as the Ra-226 result is below the RL and MDC: FSS-037-081321 (160-43084-21), FSS-038-081321 (160-43084-22), FSS-040-081321 (160-43084-24), and FSS-041-081321 (160-43084-25).

Often, such analytes are reported by gamma spectrometry assuming secular equilibrium with a longer-lived parent. The client should ensure that such inference is acceptable for their sample based upon process knowledge. The following assumptions were made for this report:
