EXECUTIVE SUMMARY

This Final Status Survey Report (FSSR) presents the results of the radiological final status survey (FSS) conducted following the demolition and decommissioning of the building 705 High Flux Beam Reactor (HFBR) Stack located at Brookhaven National Laboratory (BNL), Upton, NY. This FSSR was developed by Olgoonik/FPM JV, LLC (OFJV) under the direction of the U.S. Army Corps of Engineers (USACE) and the United States Department of Energy (DOE). The purpose of this report is to demonstrate concentrations of radionuclides of concern are below the release criterion in accordance with the Record of Decision (ROD) for Area of Concern (AOC) 31, HFBR (BNL, 2009). The remedy is being regulated under the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (CERCLA), and is consistent, to the extent practicable, with the National Oil and Hazardous Substances Pollution Contingency Plan (40 CFR 300).

The HFBR complex is centrally located within the BNL facility (Figure 1). Building 705 (the Stack) was constructed in 1949 and was used for gaseous emissions from the HFBR, the Brookhaven Graphite Research Reactor (BGRR), and other research facilities at BNL. Following demolition of the Stack the project area included:

- Pedestal: The stack was constructed on a large reinforced concrete foundation (i.e., pedestal), most of which is located below grade with the top surface at grade (elevation 124'-0"). Following decontamination activities, the entire pedestal is below grade.
- Silencer and Below Grade Duct: The silencer and below grade duct was a 44-foot-long rectangular concrete duct with dimensions of roughly 12 feet by 17 feet extending approximately 15 feet below grade. The duct was constructed from reinforced concrete with 9 and 10-inch-thick walls. A sump was located north of the west end of the silencer below grade duct (Figure 2).
- Drains: Three stormwater and drain lines built into the pedestal exited the northwest side of the pedestal. These drains discharged to a 550-gallon, double-walled, underground storage tank located northeast of the pedestal.

A survey design was developed and documented in the final Field Sampling Plan, High Flux Beam Reactor Stack (Bldg 705) Demolition and Decommissioning (FSP, OFJV 2020a). The FSP described the planned survey activities along with project cleanup goals and release criteria.

A gamma walkover survey and beta surface scan survey were performed on the top surface of the pedestal. Alpha and beta direct measurements of total surface activity and smear sample measurements of removable surface activity were performed. All total and removable radiation measurements on the pedestal were below the surface contamination values for use in the unrestricted release of material, equipment, and property.

Gamma walkover surveys were performed over all exposed soil surfaces in radiologically impacted areas surrounding the pedestal. Soil samples were collected from three depths at each sample location (0 to 6 inches, 6 to 12 inches, and 18 to 24 inches below ground surface). Concrete core samples were collected from the top two inches of the pedestal surface. Individual sample results were compared with the project release criteria, and exposure pathway modeling was performed to evaluate radiation dose to current and future site occupants.

The results of the dose assessment are below the limits established in the HFBR ROD, including the dose objective of 15 mrem/yr and the New York State Department of Environmental Conservation (NYSDEC) cleanup guideline of 10 mrem/yr adopted as an As Low As Reasonably Achievable (ALARA) goal.

1.0 INTRODUCTION

This Final Status Survey Report (FSSR) describes the radiological final status survey (FSS) activities performed following the demolition and decommissioning (D&D) of the Building 705 High Flux Beam Reactor (HFBR) Stack located at Brookhaven National Laboratory (BNL), Upton, NY. This FSSR was developed by Olgoonik/FPM JV, LLC (OFJV) under the direction of the U.S. Army Corps of Engineers (USACE) and the United States Department of Energy (DOE).

This FSSR is focused on demonstrating radiological compliance as defined in the Multi-Agency Radiation Survey and Site Investigation Manual (MARSSIM, EPA, 2000). The FSS design and survey objectives are documented in the final Field Sampling Plan, High Flux Beam Reactor Stack (Bldg 705) Demolition and Decommissioning (FSP, OFJV 2020a).

1.1 PURPOSE AND OBJECTIVE

The purpose of this Final Status Survey Report (FSSR) is to document the results of the FSS following D&D of the HFBR Stack, associated structures, and surrounding soils and to demonstrate compliance with the Record of Decision (ROD) for Area of Concern (AOC) 31, HFBR (BNL, 2009). The remedy is being regulated under the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (CERCLA), and is consistent, to the extent practicable, with the National Oil and Hazardous Substances Pollution Contingency Plan (40 CFR 300).

The primary objectives of the FSS are to:

- Identify survey unit boundaries,
- Classify survey units,
- Demonstrate the potential dose is below the ROD requirement for each survey unit, and
- Demonstrate the potential dose from small areas of elevated activity is below the ROD requirement for each survey unit.

The FSS provides data to demonstrate all specified compliance parameters satisfy the guideline values and conditions established in the ROD.

1.2 DEVIATIONS FROM PLANNING DOCUMENTS

No field change requests were submitted for deviations from the FSS design as documented in the FSP (OFJV 2020a) and the final Uniform Federal Policy-Quality Assurance Project Plan (UFP-QAPP), High Flux Beam Reactor Stack (Bldg 705), Area of Concern 31 (OFJV 2020b).

Direct measurements were performed at four systematic locations and three bias locations on the concrete pedestal on September 8, 2021 with an instrument that had not had daily operational checks performed. The instrument had a current calibration, and no issues were identified during the pre-operational checks (i.e., battery check, high voltage check, lack of physical damage to the instrument). The results of the measurements performed with this instrument on September 8, 2021 were rejected during data validation (see Section 6.1). The results of these measurements were not used to evaluate compliance with the HFBR ROD. However, the results of these measurements are consistent with the conclusions about the radiological status of the concrete pedestal based on the accepted FSS results.

No smear samples were collected from the four systematic locations and three bias locations on the concrete pedestal investigated on September 8, 2021. The direct measurement results were

rejected, and no removable activity measurements were performed. The lack of data describing these seven locations is not considered a data gap based on the 177 direct measurements and 177 removable activity measurements performed on the concrete pedestal. The usable alpha and beta activity data combined with the seven concrete core samples, statistical test results, and dose calculations describing the radiological conditions associated with the concrete pedestal meet the objectives for the FSS.

The FSP identified generic boundaries for individual survey units (SUs) and estimated areas and locations for systematic samples. The final SU boundaries were adjusted based on site conditions following D&D of the Stack. Adjusting the SU boundaries did not result in a change to the number of SU's or the number of sample locations. The establishment of final SU boundaries is discussed in Section 5.1.

The FSP specified six concrete core samples would be collected from the pedestal during the FSS. One sample was planned for the concrete slope where the silencer connected to the Stack on the west side of the pedestal. Most of the concrete slope on the west side of the pedestal was removed during D&D activities, so this sample could not be collected. Two bias concrete sample locations were identified based on the gamma walkover survey of the pedestal, so the total number of concrete samples collected as part of the FSS did not change.

Table 1-1 and Table 3-1 of the FSP incorrectly identified as low as reasonably achievable (ALARA) cleanup goals for uranium-235 (U-235) and uranium-238 (U-238) as 270 picocuries per gram (pCi/g) instead of 3.3 pCi/g and did not include carbon-14 (C-14) as a radionuclide of concern. Table 3-1 in Section 3.1 of this report corrected these problems.

A large subsurface object was encountered at one soil sample location. The subsurface sample from 18 to 24 inches below ground surface could not be collected from that location due to refusal. The samples from 0 to 6 and 6 to 12 inches below ground surface were collected from that location with concentration results below the corresponding average reference background area (RBA) concentration.

Deviations from the planning documents did not impact the overall quality of the FSS or the quality of the usable data collected. The FSS produced data of sufficient quality and quantity to support decision about the radiological status of the site and met the survey objectives.

1.3 REPORT ORGANIZATION

This report consists of nine sections and provides descriptions of the specific activities involved in the implementation of the FSS.

- Section 1.0 provides an introduction, the purpose and objective for the FSS, and this report organization.
- Section 2.0 presents the site location, description, and a brief site history.
- Section 3.0 describes the FSS design and provides a review of the data quality objectives (DQOs) for the project.
- Section 4.0 describes the survey instrumentation including calibration and operational checks.
- Section 5.0 describes the FSS field activities and summarizes the results of the FSS.
- Section 6.0 presents the evaluation of the FSS results including data validation, exploratory data analysis, and a data quality review.

- Section 7.0 provides the results of the dose modeling and describes the exposure pathway models and selection of modeling parameters.
- Section 8.0 presents conclusions and recommendations based on the results of the FSS.
- Section 9.0 provides a list of documents used to compile this report.

2.0 SITE CONDITIONS AND HISTORY

2.1 SITE LOCATION

BNL is owned by the U.S. Department of Energy (DOE) and located in Suffolk County on Long Island, about 65 miles east of midtown Manhattan (Figure 1). BNL has operated since 1947 as a research facility for national science and technology programs and is expected to continue this mission for the foreseeable future. BNL is operated by Brookhaven Science Associates, Inc (BSA).

The BNL site covers almost 5,320 acres, much of which is wooded. Large, specialized research facilities occupy approximately 200 acres near the center of the Site.

2.2 SITE DESCRIPTION AND HISTORY

The HFBR complex is centrally located within the BNL facility (Figure 2). The HFBR was designed and constructed for basic experimental research. During its operating lifetime from 1965 to 1996, it provided neutrons for materials science, chemistry, biology, and physics experiments. The Brookhaven Graphite Research Reactor (BGRR) was the first reactor in the United States built solely to perform experiments. It operated from 1950 to 1968. The HFBR Stack, Building 705, was constructed in 1949 and was used for gaseous emissions from the HFBR, BGRR, and other research facilities at BNL.

Final status surveys have been completed for former buildings and soils in the areas surrounding Building 705 and are summarized in the following closeout reports:

- BNL, 2011a, Final Closeout Report, High Flux Beam Reactor Underground Utilities Removal Area of Concern 31, prepared by Brookhaven Science Associates for the U.S. Department of Energy, August 2011.
- BNL, 2011b, Final Closeout Report, High Flux Beam Reactor Fan Houses (Building 704 and Building 802) Decontamination and Dismantlement (D&D), prepared by Brookhaven Science Associates for the U.S. Department of Energy, November 2011.
- BNL, 2012, Final Closeout Report, High Flux Beam Reactor Removal of the Stack Silencer Baffles and Final Status Survey for Remaining HFBR Outside Areas, Area of Concern 31, prepared by Brookhaven Science Associates for the U.S. Department of Energy, May 2012.

The building 705 Stack and associated structures were removed prior to initiating FSS activities for the Building705 Stack Demolition Project. Following the demolition of the Stack, the remaining subsurface section of the building 705 silencer including the floor drain and remainder of the silencer sump were removed. The stack stormwater collection system including the 550-gallon collection tank, the drain line connecting the tank with the pedestal drains, and the remaining drain line connected to the system that connected to former Building 704 were removed. The areas where FSS activities were performed are shown in Figure 2.

2.3 RADIONUCLIDES OF CONCERN

The primary radiological contaminants of concern for the soil within the remaining HFBR Outside Areas were specified in the HFBR ROD (BNL, 2009) and are the same as those for OU I radiologically contaminated soils specified in the OU I ROD: Cs-137, Ra-226, and Sr-90.

Additional radionuclides that were not addressed in the OU I ROD were also considered based on historical data reviews and data gap characterization efforts performed in early 2020. In April 2001 a single sample described as "dirt from the stack" was collected and analyzed by gamma spectroscopy. The material inside the stack identified Cs-137 and Ra-226, as well as cobalt-60 (Co-60) and americium-241 (Am-241) which were added to the list of radioactive contaminants of concern. Water samples collected from the stack stormwater collection system have reported tritium (H-3) levels exceeding ambient water quality standards, so H-3 was added to the list of radioactive contaminants of concern. Radiological characterization of the ducts associated with Building 704 and Building 802 indicated that they were contaminated with Co-60, nickel-63 (Ni-63), and cesium Cs-137, so Ni-63 was included as a radioactive contaminant of concern. The Building 705 Stack-Resolution of End-Sate Report (PWGC, 2005) states fuel failures at the BGRR resulted in releases of uranium oxides that would have adhered to the interior surfaces of the stack; therefore, U-235 and U-238 were included as radioactive contaminants of concern. In addition, the BGRR could have released activated carbon through the Stack, so C-14 was included as a radioactive contaminant of concern. Based on the known presence of Am-241 inside the stack and the likely presence of uranium oxides from fuel failures, plutonium-238 (Pu-238), plutonium-239 (Pu-239), plutonium-240 (Pu-240) and plutonium-241 (Pu-241) were added to the list of radionuclides of concern. Europium-152 (Eu-152) and europium-154 (Eu-154) are fission products produced in nuclear reactors, like Cs-137 and Sr-90, and have been identified as radioactive contaminants of concern for previous HFBR final status surveys and are included as radioactive contaminants of concern. Europium-155 (Eu-155) and sodium-22 (Na-22) were identified during the historical data reviews and included as radionuclides of concern.

2.4 CONCEPTUAL SITE MODEL

Airborne radiological contaminants of concern entered the Stack through the silencer and other air ducts. Radioactivity was deposited on the interior surfaces of the Stack and over time migrated into the Stack materials.

The pedestal formed the base of the stack. The pedestal was constructed from four tiers of reinforced concrete. Each tier was two feet thick and extended two feet beyond the edge of the tier above. Radionuclides present on the interior walls of the stack were also present on the exposed surface of the pedestal. Over time radionuclides migrated into and penetrated the concrete surface of the pedestal. During characterization the highest concentrations of radionuclides were identified on the surface, diminishing with depth. During demolition elevated levels of radioactivity were identified deeper in the concrete than expected. The top foot of concrete was removed from the surface of the pedestal along with the slope on the west side of the pedestal where the silencer connected with the Stack. An additional foot of concrete was removed from an area of elevated activity associated with cracks in the concrete. The removed concrete resulted in a trench in the surface of the pedestal approximately one foot deep, two feet wide and 14 feet long (see Figure 4). Concrete from the upper portion of the second tier of the pedestal was removed inside the trench.

The drain lines built into the pedestal are constructed from stainless steel. Radioactivity would enter the drains as liquid or fine particulates suspended in water.

The soil surrounding the silencer and the pedestal was previously surveyed and released for residential land use after 50 years of industrial use and institutional controls by DOE as described in the ROD (BNL, 2009) and closeout surveys for the surrounding areas (BNL, 2012). This clean overburden was excavated and stockpiled during remedial activities. The overburden was screened and used as backfill as described in Section 3.10 of the Closeout Report.

The exposed surface of the pedestal was investigated as part of the FSS. The exposed soil surrounding and beneath the silencer was exposed as part of this FSS. The soil surrounding and beneath the stormwater collection system, including the drain lines and collection tank, was investigated as part of this FSS. The exposed soil and asphalt inside the radiation control area that could have been impacted by demolition of contaminated structures, handling of radioactive waste, loading of waste containers, and transport of radioactive materials inside the radiation control area was investigated as part of this FSS.

3.0 FINAL STATUS SURVEY DESIGN

The objective of the FSS was to demonstrate compliance with the dose limits stated in the HFBR ROD (BNL, 2009). The FSS of the concrete pedestal included a beta scan survey, alpha and beta direct measurements at systematic and bias locations, alpha and beta smears at direct measurement locations, a gamma walkover survey, and concrete core samples at systematic and bias locations. The FSS of the soil areas included gamma walkover surveys and collection of soil samples at systematic and bias locations. Samples were collected from three depths at each soil sample location: 0 to 6 inches, 6 to 12 inches, and 18 to 24 inches.

3.1 CLEANUP GOALS

3.1.1 Soil Cleanup Goals

The cleanup goals for specific radionuclides in soil were calculated using the Residual Radioactivity Computer Code (RESRAD), Version 6.5 (Argonne National Laboratory, 2001), considering a residential scenario. The cleanup goals for concrete are the same as the cleanup goals for soil (BNL 2010). The dose limit used was 15 millirem per year (mrem/yr) above background (Office of Solid Waste and Emergency Response Directive 9200.4-1, EPA, 1997), residential land use after 50 years of institutional control by the DOE, and industrial land use with no decay time (Year 0). In addition, the New York State Department of Environmental Conservation (NYSDEC) cleanup guideline of 10 mrem/yr, from DER-38 (NYSDEC 2013), was adopted as an As Low as Reasonably Achievable (ALARA) goal. Radionuclides of concern without a cleanup goal were evaluated using RESRAD. Table 3-1 lists the radionuclides of concern and the soil cleanup goals.

3.1.2 Surface Cleanup Goals

The cleanup goals for the concrete surface of the pedestal are the pre-approved authorized release criteria for use in the unrestricted release of material, equipment, and property in accordance with DOE Order 458.1 (DOE 2020). Table 2-6 of the BNL Radiological Control Manual (BNL 2020) provides the surface contamination values for use in the unrestricted release of material, equipment, and property. Table 3-1 lists the radionuclides of concern and the concrete surface cleanup goals.

The evaluation of surface cleanup goals is based on the radionuclides of concern listed in the HFBR ROD (BNL 2009); Sr-90, Cs-137, and Ra-226. Other radionuclides of concern listed in Table 3-1, including H-3 and Ni-63, were evaluated against the HFBR ROD criteria as part of the dose modeling.

Table 3-1. Soil and Surface Cleanup Goals for Radionuclides of Concern

Radionuclide of Concern	Cleanup Goals for Concrete Surfaces (dpm/100 cm^2)		Cleanup Goals for Volumetric Samples Based on the 10 mrem/yr ALARA Goal (pCi/g)
	Total	Removable	
H-3	Note 1	10,000 β	Note 2
C-14	5,000 β	1,000 β	Note 2

1. Tritium contamination may diffuse into the volume or matrix of materials. Evaluation of surface contamination shall consider the extent to which such contamination may migrate to the surface in order to ensure the surface contamination value is not exceeded. Once this contamination migrates to the surface, it may be removable, not fixed; therefore, a "Total" value does not apply. In certain cases, a “Total” value of 10,000 dpm/100 cm^2 may be applicable either to metals of the types from which insoluble special tritium compounds are formed, that have been exposed to tritium, or to bulk materials to which insoluble special tritium compound particles are fixed to a surface.
2. If tritium, C-14, Na-22, Ni-63, Eu-155, U-234, or Pu-241 are detected in soil samples above the detection limit or above the mean reference area concentration, a RESRAD evaluation will be conducted using the reported soil concentration. The analysis will include an evaluation of groundwater pathways to ensure that the projected drinking water pathway annual dose to the receptor is less than 4 mrem.

3.2 AREA CLASSIFICATION

Classification is the process by which an area or SU is described according to radiological characteristics. The classification process determines the FSS design, and the level of survey effort associated with the FSS. The entire site was classified as Class 1, requiring the greatest level of effort for the FSS.

3.3 REVIEW OF DATA QUALITY OBJECTIVES

The Data Quality Objective (DQO) development process (USEPA, 2006) was used to determine the project DQOs and optimize the data collection necessary to meet the applicable decision criteria. The DQO process helped in selecting analytical methods needed to achieve appropriate detection limits. The DQOs specified the type, quality, quantity, and uses of data required for decision making. There are seven steps in the DQO Process described in MARSSIM (USEPA, 2001).

3.3.1 Step 1 – State the Problem

The Stack was removed down to the pedestal and the top layer of concrete was removed from exposed concrete surfaces, but residual radioactivity could remain on the concrete surface.

The stainless-steel drain lines installed inside the concrete pedestal were used to collect potentially contaminated stormwater, and residual radioactivity may remain inside the pipes.

The soil beneath the subsurface silencer structures and the Stack stormwater collection system drain lines and storage tank may have been contaminated by radioactive material through leaks.

3.3.2 Step 2 – Identify the Decision

The principal study question was:

“Do the residual radionuclide concentrations in remediated site soils and concrete exceed volumetric cleanup criteria and ALARA goals specified in the HFBR ROD (BNL, 2009) and based on residential future land use after fifty years of industrial use and institutional controls by DOE?”

A secondary study question was: “Does the residual surface radioactivity on the remaining decontaminated concrete pedestal surface exceed the authorized release criteria established for BNL under DOE Order 458.1 (DOE 2020)?”

Decision statements for the FSS included:

- Determine whether the sum of fractions exceeded unity for the primary radionuclides (i.e., ^{137}Cs, ^{90}Sr, ^{226}Ra) based on ALARA limits for radionuclides provided in Table 3-1.
- Determine whether the sum of fractions exceeded unity for all detected radionuclides based on ALARA limits for radionuclides with limits provided in Table 3-1.
- Determine whether the surface activity levels on the pedestal exceeded the surface activity limits provided in Table 3-1.
- Determine whether the total dose from all detected radionuclides exceeded the 15 mrem/yr limit specified in the ROD.

3.3.3 Step 3 – Identify Inputs to the Decision

The following site characteristics were determined to resolve the applicable decision statements:

- Exposed concrete surfaces were scanned for beta radiation.
- Alpha and beta total activity direct measurements were performed on exposed concrete surfaces.
- Alpha and beta RBA total activity measurements were performed on concrete outside Building 610.
- Alpha and beta removable activity measurements were performed on exposed concrete surfaces.
- Alpha and beta removable activity measurements were performed on the inside surfaces of the pedestal drain lines at the inlet and outlet for each section of drain line.
- Gamma walkover surveys were performed on all exposed concrete and soil horizontal surfaces to identify areas of locally elevated gamma radiation.
- Soil and concrete samples were collected and sent to a commercial laboratory for radionuclide-specific analysis. A WRS test comparing the pedestal concrete samples with the RBA concrete samples for sum of fraction values based on the radionuclide and chemical contaminants of concern cleanup goals listed in Table 3-1 was performed and demonstrated the residual concentrations exceed the RBA concentrations by less than unity.
- A WRS test comparing the soil samples from each survey unit with the RBA soil samples for sum of fraction values based on the radionuclide and chemical contaminants of concern cleanup goals listed in Table 3-1 was performed and demonstrated the residual concentrations exceed the RBA concentrations by less than unity.
- A post-cleanup radiological dose assessment was performed and reported a total dose for the Stack area of less than 10 mrem/yr for all modeled exposure scenarios.

3.3.4 Step 4 – Define the Study Boundaries

The areas of interest are defined in Section 2.2 and include the concrete pedestal, the soils under the silencer, the soils under the Stack stormwater collection system, and any additional radiologically impacted areas resulting from Stack demolition activities. Figure 2 provides generic outlines for the different areas of interest, but the actual boundaries of the survey areas are defined and discussed in Section 5.1. All wastes handled in the railyard were securely packaged for DOT transport with no reported leaks. Therefore, there was no potential for OFJV activities to spread of contamination to the railyard. The railyard remained non-impacted and was not included as part of this FSS.

3.3.5 Step 5 – Develop Decision Rules

Concrete Pedestal Decision Rules:

- If a gamma walkover survey measurement result exceeded the mean of the survey unit data plus three times the standard deviation of the survey unit data a concrete core sample was collected at that location.
- If a beta scan survey measurement result exceeded the mean of the survey unit data plus three times the standard deviation of the survey unit data a bias direct measurement for alpha and beta total surface activity was performed at that location.

Soil Area Decision Rules

- If a gamma walkover survey measurement result exceeded the mean of the survey unit data plus three times the standard deviation of the survey unit data a bias soil sample was collected at that location.
- A WRS test comparing the soil samples from each survey unit with the RBA soil samples for sum of fraction values based on the radionuclide and chemical contaminants of concern cleanup goals listed in Table 3-1 was performed and demonstrated the residual concentrations exceed the RBA concentrations by less than unity.
- A post-cleanup radiological dose assessment was performed and reported a total dose for the Stack area of less than 10 mrem/yr for all modeled exposure scenarios.

3.3.6 Step 6 – Specify Limits on Decision Errors

For the purposes of the FSS, the acceptable error rate for both Type I and Type II errors is five percent (i.e., $\alpha = \beta = 0.05$).

3.3.7 Step 7 – Optimize the Design for Collecting Data

Operation details for the FSS are provided in the final approved FSP (OFJV 2020a) and UFP-QAPP (OFJV 2020b).

4.0 MEASUREMENT TECHNIQUES AND SURVEY INSTRUMENTATION

The purpose of this section is to describe radiological survey instruments and techniques that were implemented during the FSS.

4.1 MEASUREMENT TECHNIQUES

Measurements were performed for gamma, beta and alpha radiation. Survey techniques included scans, direct measurements, smears to measure removable radioactivity, collection of solid samples, and laboratory analysis of samples.

4.1.1 Gamma Walkover Surveys

A gamma walkover survey was performed over 100% of the accessible soil and concrete surfaces exposed following demolition/remediation activities. These surveys provided position-correlated gross gamma count rate data proportional to the gross gamma fluence rate at the ground surfaces. The results of these surveys were used to detect areas of elevated activity and select locations for bias samples.

Gamma walkover survey results exceeding the average SU result by more than three standard deviations (z-score greater than 3.0) were investigated to determine the source of the elevated reading. If the source of elevated activity was residual contamination, or the source of elevated activity could not be determined, a bias sample was collected at that location.

4.1.2 Beta Surface Activity Scans

A beta scan was performed over 100% of the accessible concrete surfaces exposed following demolition activities. These scans provided position correlated gross beta count rate data. The results of the beta scan surveys were used to identify areas of elevated beta activity for further investigation using alpha and beta direct measurements of surface activity.

Beta surface scan results with a z-score greater than 3.0 were investigated to determine the source of the elevated reading. If the source of elevated beta activity was residual contamination or the source of elevated activity could not be identified, and the location was not previously identified for collection of a bias sample, a bias direct measurement was performed.

4.1.3 Alpha/Beta Direct Measurements

Alpha/beta direct measurements were performed at systematic and bias locations on the surface of the concrete pedestal. The results of the direct measurements were compared with the surface cleanup goals for total activity listed in Table 3-1 to determine compliance with the surface contamination values from the BNL Radiological Control Manual (BNL, 2020) for use in the unrestricted release of material, equipment, and property.

4.1.4 Alpha/Beta Smear Measurements

Alpha/beta smear measurements were performed at each location where an alpha/beta direct measurement was performed. The results of the smear measurements were compared with the surface cleanup goals for removable activity listed in Table 3-1 to determine compliance with the surface contamination values from the BNL Radiological Control Manual (BNL, 2020) for use in the unrestricted release of material, equipment, and property.

4.1.5 Sample Collection and Analysis

Samples were collected from accessible soil and concrete surfaces exposed following demolition activities. Soil samples were collected from three depths at each location: 0 to 6 inches, 6 to 12 inches, and 18 to 24 inches below ground surface. Concrete core samples were collected from the top two inches of exposed concrete on the pedestal. Solid samples were sent to a commercial laboratory for analysis for radionuclides of concern listed in Table 3-1. Samples were analyzed in accordance with approved analytical procedures provided in the UFP-QAPP (OFJV 2020b).

Sample containers were marked to show the sample identification number, date and time the sample was collected, the requested analyses, and the initials of the person collecting the sample. Sample identification number, northing and easting coordinates, and other pertinent data were recorded on appropriate field data recording sheets. Samples were collected in accordance with applicable chain of custody procedures as described in the UFP-QAPP.

4.2 INSTRUMENT CALIBRATION

Instruments used during the FSS had current calibration/maintenance records. Calibration records include the following:

- Name of the equipment,
- Equipment identification (model and serial number) and manufacturer,
- Date of calibration,
- Calibration due date.

Instruments were calibrated at a facility possessing appropriate Nuclear Regulatory Commission (NRC) and/or Agreement State licenses for performing calibrations using National Institute of Science and Technology (NIST) traceable sources. Copies of instrument calibration records are provided in Appendix A.

4.3 INSTRUMENT OPERATIONAL CHECKS

Each day an instrument was used in the field operational checks were performed. Operational checks included a background count to check for contamination and a source count to demonstrate the instrument efficiency was unchanged and the instrument was detecting radioactivity properly. Instrument operational checks also included checks of the battery, physical damage, current calibration, and erroneous readings. Source checks were performed using NIST-traceable sources. Records of daily operational checks and source calibration certificates are provided in Appendix A.

The Ludlum Model 2360 data logger and Ludlum Model 43-93 scintillator did not have operational checks performed after September 1, 2021. This instrument was used to perform direct measurements on the concrete pedestal in SU 7A at four systematic locations and three bias locations.. The instrument had a current calibration, and no issues were identified during the pre-operational checks (i.e., battery check, high voltage check, lack of physical damage to the instrument).

4.4 MEASUREMENT OF GAMMA RADIATION

Gamma walkover surveys were performed using an uncollimated Ludlum Model 44-20 3x3 NaI detector coupled to a Ludlum Model 2221 scaler/ratemeter. The detector was linked with a differential global positioning system (DGPS) receiver/datalogger. The gamma detection systems were set up to measure gamma interactions in the NaI crystal that are discernable

from electronic noise. Specifically, the detection systems were calibrated with no lower-level discriminator and no upper-level discriminator (i.e., open window). Data from the scaler/ ratemeter was automatically logged into the GPS unit every second.

Using NUREG-1507, *Minimum Detectable Concentrations with Typical Radiation Survey Instruments for Various Contaminants and Field Conditions* (NRC, 1998), as guidance, scan MDCs and scanning sensitivity was calculated for Cs-137, Ra-226, and Am-241 using Microshield®. The results of the gamma walkover scan minimum detectable concentration (MDC) calculations are presented in Table 4-1. The calculations performed and the assumptions made in the sensitivity estimates are presented in Appendix B.

Table 4-1. Gamma Walkover Scan MDCs for Soil

Detector	Description	ROC	Scan MDC (pCi/g)
Ludlum Model 44-20	NaI	Cs-137	8.8
		Ra-226	2.7
		Am-241	8.9

The scan MDC calculations in Appendix B assumed a background count rate of 9,000 cpm and this estimate accurately reflects a reasonable upper limit on background measurements performed in the RBA (Section 5.1.1, Table 5-1). The maximum concentrations reported for samples at systematic locations were 0.537 pCi/g for Cs-137 and 0.843 pCi/g for Ra-226. The maximum concentrations reported for samples at bias locations were 4.05 pCi/g for Cs-137 and 1.06 for Ra-226. The scan MDC achieved for gamma walkover surveys was lower than the a priori estimate. The most likely cause was the slower scan speed associated with scanning from a manlift (see Section 5.4).

4.5 MEASUREMENT OF ALPHA AND BETA RADIATION

Measurements of alpha and beta radiation on the concrete pedestal were performed using a Ludlum Model 2360 data logger connected to a Ludlum 43-37 large area gas proportional detector or a Ludlum Model 43-93 scintillator. The Ludlum Model 2360 data logger was used to separately count alpha and beta concurrently and record the results, Scan surveys were performed using the Ludlum Model 43-37 detector connected to a DGPS to provide position-correlated survey results.

A Ludlum Model 2929 sample counter with a Ludlum Model 43-10-1 scintillator was used for counting smears. The Model 2929 provides simultaneous alpha and beta counting using a shielded 2-inch diameter sample tray.

4.5.1 Determination of Efficiency

Instrument efficiencies for alpha and beta measurements were calculated based on the guidance found in International Standard 7503 (ISO 2016). The Ludlum Model 43-37 detector used a 150 cm^2 Sr-90 source for beta instrument efficiency and a 150 cm^2 Th-230 source for alpha instrument efficiency. The Ludlum Model 43-93 detector and the Ludlum Model 2929 sample counter used a

15 cm^2 Tc-99 source for beta instrument efficiency and a 15 cm^2 Th-230 source for alpha instrument efficiency. All sources were NIST traceable. Multiple counts were performed on each detector, repositioning the source for each count, to cover the entire active area of the detector. A minimum of 10,000 counts were collected for each detector with each source to reduce uncertainty from counting statistics. Instrument efficiencies for the Ludlum 43-37 detector were established with the detector in contact with the surface being measured, with the detector approximately 1 cm above the surface being measured, and with the detector approximately 2 cm above the surface being measured to account for different source to detector distances used for scan surveys and direct measurements in contact with the surface. Instrument efficiencies for the Ludlum 43-93 detector were determined with the detector in contact with the surface being measured and are only applicable to direct measurements on contact with the surface. Instrument efficiencies for the Ludlum 2929 were determined with the source positioned in the sample holder in the same position used for counting smears.

Surface efficiency values were selected based on the emission energies of the radionuclides of concern using recommendations from International Standard 7503 (ISO 2016). The surface cleanup goal for beta activity listed in Table 3-1 was selected based on Sr-90. The surface efficiency for beta particles was based on the beta particle energy of Sr-90 and the Y-90 daughter. The surface efficiency for beta particles was set at 50%. The recommended surface efficiency for all alpha particles is 25%, so the surface efficiency for alpha particles was set at 25%.

Tritium and other difficult-to-detect radionuclides were not considered during the development of an instrument efficiency for beta radiation. The historical information and characterization data used to develop the survey design indicated there was little or no H-3 present on concrete surfaces, so the selection of survey instruments did not require detection of low-energy beta particles. The beta direct measurements of total surface activity do not account for the presence of H-3 on concrete surfaces. The presence of H-3 in concrete was evaluated based on laboratory analysis of volumetric concrete core samples.

Total efficiency was calculated by multiplying the instrument efficiency by the surface efficiency. Results of the source counts and efficiency calculations are provided for each detector in Appendix B. Copies of source calibration certificates are provided in Appendix A.

4.5.2 Determination of Beta Scan MDC

MARSSIM Section 6.7.2.1 provides guidance on determining the scan MDC for beta radiation on concrete surfaces. The scan MDC for beta activity is 424 disintegration per minute per 100 square centimeters (dpm/100 cm^2). The calculations performed and the assumptions made to determine this scan MDC are presented in Appendix B and summarized in Table 4-2.

Table 4-2. Scan MDC for Beta Radiation

Model #	Detector Height (cm)	Probe Area (cm^2)	Bkgd (cpm)[a]	Bkgd Count Time (sec)	Sample Count Time (sec)	Total Efficiency (cpm/dpm)	Scan MDC (dpm/100 cm^2)
43-37	1	584	1008.5	1200	1	0.200	411
43-37	2	584	1008.5	1200	1	0.185	444

a Background cpm are the average cpm from the RBA

The scan MDC for surface scan surveys for beta activity with the detector positioned 2 cm above the surface with a scan speed of one detector width per second is 444 dpm/100 cm^2. The scan MDC for beta activity is less than half the beta cleanup goal of 1,000 dpm/100 cm^2 and meets the objectives for the FSS.

4.5.3 Determination of Alpha/Beta Direct Measurement MDC

The direct measurement MDC is the level of radioactivity practically achievable by the overall measurement process. The following equation, from the Multi-Agency Radiation Survey and Assessment of Materials and Equipment (MARSAME, USEPA 2009) Table 7.6 Equation 4, is used to calculate the direct measurement MDC in units of dpm/100 cm^2 when the background and sample were counted using different time intervals:

$$MDC = \frac{\frac{\left(z_{1-\alpha} + z_{1-\beta}\right)^2}{4}\left(1 + \frac{t_S}{t_B}\right) + \left(z_{1-\alpha} + z_{1-\beta}\right)\sqrt{N_B \frac{t_S}{t_B}\left(1 + \frac{t_S}{t_B}\right)}}{\varepsilon_t t_S \frac{W_A}{100}}$$

Where:

$z_{1-\alpha}$ = quantile of the standard normal distribution for α (1.645 for α =0.05)

$z_{1-\beta}$ = quantile of the standard normal distribution for β (1.645 for β =0.05)

t_S = sample counting time (minutes)

t_B = background counting time (minutes)

N_B = number of background counts during background counting time

ε_t = instrument efficiency (counts per particle)

W_A = active area of the detector window (cm^2)

The direct measurement MDC values for alpha and beta measurements in contact with the surface are listed in Table 4-3.

Table 4-3. Direct Measurement MDCs for Alpha and Beta Radiation

Model #	Radiation Type	Probe Area (cm^2)	Bkgd (cpm)[a]	Bkgd Count Time (sec)	Sample Count Time (sec)	Total Efficiency (cpm/dpm)	Direct Measurement MDC (dpm/100 cm^2)
43-37	Alpha	584	8.9	1200	60	0.215	42
	Beta	584	1008.5	1200	60	0.0524	87
43-93	Alpha	100	2.3	960	120	0.120	54
	Beta	100	278.9	960	120	0.0977	356

a Background cpm are the average cpm from the RBA

The direct measurement alpha MDC using the Ludlum Model 43-37 detector for 1-minute counts on contact with the surface and the Ludlum Model 43-93 detector for 2-minute counts on contact with the surface are less than the alpha cleanup goal of 100 dpm/100 cm^2 and meets the objectives for the FSS. The direct measurement beta MDC using the Ludlum Model 43-37 detector for 1-minute counts on contact with the surface and the Ludlum Model 43-93 detector for 2-minute counts on contact with the surface are less than the beta cleanup goal of 1,000 dpm/100 cm^2 and meets the objectives for the FSS.

4.5.4 Determination of Alpha/Beta Smear MDC

The smear MDCs for removable alpha and beta radioactivity measured with the Ludlum Model 2929 sample counter were calculated using the equation presented in Section 4.5.3. The calculation uses a smear area of 100 cm^2. The smear MDC values are listed in Table 4-4.

Table 4-4. Smear MDCs for Removable Alpha and Beta Radiation

Model #	Radiation Type	Smear Area (cm^2)	Bkgd $(cpm)^2$	Bkgd Count Time (sec)	Sample Count Time (sec)	Total Efficiency (cpm/dpm)	Smear MDC (dpm/100 cm^2)
2929	Alpha	100	0.1	9600	60	0.17	20
	Beta	100	36	9600	60	0.16	427

a Background cpm are the average cpm from the RBA

The smear measurement alpha MDC using the Ludlum Model 2929 sample counter for 1-minute counts is equal to the alpha removable activity cleanup goal of 20 dpm/100 cm^2 and meets the objectives for the FSS. The smear measurement beta MDC using the Ludlum Model 2929 sample counter for 1-minute counts is less than the beta removable activity cleanup goal of 200 dpm/100 cm^2 and meets the objectives for the FSS.

5.0 FINAL STATUS SURVEY ACTIVITIES AND RESULTS

Final status survey data collection activities were initiated on August 6, 2021 and completed on September 8, 2021. These activities included gamma walkover surveys of accessible horizontal surfaces, beta surface scans of the concrete pedestal, alpha and beta direct measurements on the concrete pedestal, alpha and beta smears of removable activity on the concrete pedestal, concrete core samples on the pedestal at systematic and bias locations, and soil sample collection at systematic and bias locations.

5.1 REFERENCE BACKGROUND AREAS

Reference background areas were selected from non-impacted areas at BNL to provide data representative of background. Locations of the soil RBA and the concrete RBA are shown in Figure 2 inset.

5.1.1 Soil Reference Background Area

The soil RBA is located along a fire road southeast of the HFBR. A gamma walkover survey was performed on March 17, 2021 to provide an investigation level to support remedial action support surveys, assist in identification of soils requiring removal to meet project cleanup goals, and determine when FSS activities could begin. Table 5-1 summarizes the results of the soil RBA gamma walkover survey.

Table 5-1. Soil Reference Background Area Gamma Walkover Survey Results

Minimum	Maximum	Mean	Standard Deviation (σ)	Mean + 3σ	Number of Measurements
6,239 cpm	9,770 cpm	7,874 cpm	627 cpm	9,755 cpm	540

Surface soil samples were collected on March 17, 2021. Sixteen samples were collected from random locations within the RBA. The samples were sent to a commercial analytical laboratory for analysis. Table 5-2 summarizes the results of the soil RBA sample analyses. Included in the data summary is the 95% upper confidence level on the mean representing the average activity used for dose calculations, a background threshold value (BTV) representing the maximum value consistent with the background distribution, and a sum of fractions (SOF) value for use in the statistical tests in Section 6.4. The analytical laboratory results for the soil RBA samples are provided in Appendix A of the Closeout Report and summarized in Appendix C of this report.

Table 5-2. Soil Reference Background Area Summary of Analytical Results (pCi/g)

Nuclide	Minimum	Maximum	Mean	Standard Deviation	Median	95% UCL	BTV
Sr-90	0.0314	0.244	0.123	0.069	0.126	0.153	0.292
Cs-137	0.0287	0.283	0.187	0.0765	0.199	0.22	0.374
Ra-226	0.321	0.668	0.513	0.0915	0.51	0.553	0.737
U-235	-0.00536	0.049	0.0181	0.0168	0.0151	0.0254	0.059
U-238	0.30	0.475	0.384	0.0527	0.381	0.407	0.513
SOF	0.150	0.334	0.286	0.045	0.289	0.306	0.396

5.1.2 Concrete Reference Background Area

The concrete RBA is located on an outdoor loading ramp attached to Building 610. The loading ramp is weathered outdoor concrete similar to the concrete pedestal and is non-impacted. BNL personnel collected concrete cores from six random locations on the ramp on April 13, 2021. The concrete cores were 2-inches in diameter and approximately 10 inches long to provide sufficient material to complete all the required laboratory analyses. Table 5-3 summarizes the results of the concrete RBA sample analyses. The analytical laboratory results for the concrete RBA samples are provided in Appendix A of the Closeout Report and summarized in Appendix C of this report.

Table 5-3. Concrete Reference Background Area Summary of Analytical Results (pCi/g)

Nuclide	Minimum	Maximum	Mean	Standard Deviation	Median	95% UCL	BTV
Sr-90	-0.0286	0.334	0.0966	0.147	0.0511	0.217	0.364
Cs-137	-0.0323	0.03	-0.00292	0.0246	-0.00852	0.0173	0.0418
Ra-226	0.0259	0.438	0.26	0.158	0.251	0.39	0.547
U-235	-0.00979	0.0446	0.0167	0.0207	0.0136	0.0338	0.0545
U-238	0.131	0.348	0.25	0.074	0.256	0.311	0.385
SOF	0.0869	0.248	0.146	0.072	0.110	0.272	0.294

5.2 SURVEY UNIT BOUNDARIES

The MARSSIM Glossary states that SUs are generally formed by grouping contiguous site areas with a similar use history and the same classification of contamination potential. MARSSIM Section 4.6 suggests an upper limit on the area of a Class 1 survey unit of 2,000 m^2 and a minimum area of 100 m^2.

The HFBR outdoor areas were divided into SUs as part of previous investigations (BNL 2012) and the FSS activities fall primarily inside the boundary for HFBR SU 7 as shown in Figure 3. After completion of the HFBR Stack Demolition Area grading and minor remediation, the final boundaries for individual SUs were established. The HFBR Stack Demolition Area was divided into four Class 1 SUs.

The concrete pedestal was identified as SU 7A. The boundaries of SU 7A are the edges of the concrete pedestal. Only the top tier of the pedestal was completely exposed, along with the upper surface of the second tier. The bottom two tiers were not exposed and were not accessible for FSS measurements. During demolition activities the west side of the pedestal where the Silencer attached to the Stack was removed. A trench was cut in the pedestal extending into the second tier of the pedestal. A 3-foot by 3-foot grid was established on the pedestal surface as a reference coordinate system. Figure 4 shows SU 7A, the reference grid, the trench cut into the surface, and the sections removed on the west side of the pedestal. The drainpipes embedded in the concrete pedestal connected to the Stack Stormwater Collection System are part of SU 7A.

The Silencer excavation was identified as SU 7B. The FSP (OFJV 2020a) indicated SU 7B would be limited to the soil directly beneath the Silencer. This SU was enlarged to include the area affected by the demolition of the Silencer walls and floor and removal of demolition debris and the area beneath the sump located just north of where the Silencer was joined to the underground duct connecting the Stack to the former Fan House (Building 704). Figure 3 shows the boundary

of SU 7B and the approximate locations of the Silencer and sump. Figure 3 also shows the approximate location of the trench box used to extend the Silencer excavation deeper to remove contaminated soils below the Silencer footer and former sump.

The soils beneath the former Stack Stormwater Collection System were identified as SU 7C. The boundaries of this SU include the area north of the pedestal where the Stormwater Collection Tank and associated drainpipes exiting the pedestal were located. This SU also includes the areas where former drainpipes were located connecting the Stack and other facilities to the Silencer sump. Figure 3 shows the boundaries of SU 7C including the approximate location of the trench box installed during removal of the Stormwater Collection Tank, and the approximate location of an abandoned section of drainpipe removed from the area between the Stack and the Silencer sump.

All remaining areas withing the Radiation Control Area (RCA) boundary were identified as SU 7D. The FSP described SU 7D as the waste container loading area. This area was expanded to include all areas inside the RCA based on several factors including:

- Temporary stockpiling of contaminated debris,
- Multiple waste loading areas for different types of contaminated debris,
- Transportation routes within the RCA to gain access to contaminated areas, and
- Multiple severe weather events during demolition potentially contributing to the spread of contamination inside the RCA.

Figure 3 shows the boundaries of SU 7D including the location of the asphalt pad east of the pedestal used for waste container loading and staging equipment.

The final grading of the Silencer excavation resulted in slopes that were too steep to access on foot based on the loose, sandy soil present at the site. Figure 3 shows the areas in SU 7B and SU 7D that were inaccessible on foot during FSS activities due to health and safety concerns. Table 5-4 provides a description of the final FSS SUs.

Table 5-4. Description of FSS Survey Units

SU Number	Building/OA	Class	Description	SU size (m^2)
7A	Pedestal	1	Concrete	146
7B	Silencer Excavation Underlying Soil	1	Soil	327
7C	Stack Stormwater Collection System Underlying Soil	1	Soil	138
7D	Impacted Areas	1	Soil	1,543

All SU areas are within the range for Class 1 SUs recommended in MARSSIM Section 4.6 and meet the objectives of the FSS.

5.3 ALPHA/BETA SURVEYS

Surveys of alpha and beta radiation were performed in SU 7A on the surface of the concrete pedestal. FSS survey activities for measuring alpha and beta radiation included beta scans of the pedestal surface, alpha and beta direct measurements at systematic and bias locations, and alpha and beta smear measurements of removable activity at systematic locations.

5.3.1 SU 7A Beta Scan

Beta surface scans of the pedestal surface were performed using the Ludlum Model 2360 data logger and Ludlum Model 43-37 large area gas proportional detector. Beta scan surveys were performed on August 31, September 1, and September 2, 2021. Beta surface scans covered 100% of the accessible concrete surface, including the 2-foot-wide apron of the surface of the second tier of concrete making up the pedestal. Beta surface scans were not performed in the trench cut into the surface because the trench was full of water and inaccessible for survey. A limited number of beta surface scans were performed on the sloped portions of grids G3, H3, I3, and J3 because the sloped surface was mostly inaccessible to the large area detector.

A total of 2,632 beta scan measurements were performed. The detector area was 0.0584 m^2 (584 cm^2), so the total area scanned was approximately 153 m^2. Allowing for some overlap of measurements and the lack of scan data for the area of the trench (approximately 2.25 m^2), the beta scan coverage was 100% of the accessible concrete surface. Table 5-5 summarizes the results of the beta surface scan survey. Figure 6 shows the results of the beta surface scan survey in SU 7A. The beta surface scan survey results are provided in Appendix D.

Table 5-5. Beta Surface Scan Survey Results

Minimum	Maximum	Mean	Standard Deviation (σ)	Mean + 3σ	Number of Measurements
666 cpm	1,531 cpm	981 cpm	95.5 cpm	1,267 cpm	2,632

There were six locations where the beta scan results exceeded the investigation level of a z-score greater than 3.0, where the scan result exceeded the average scan result by more than 3 standard deviations.

- Grid F4 – investigate with a bias concrete core sample,
- Grid N6/M6 – systematic direct measurements provide necessary data,
- Grid D12 – systematic direct measurement provides necessary data,
- Grid K10/K11 – investigate with a bias direct measurement,
- Grid K12 – investigate with a bias direct measurement, and
- Grid K15 – investigate with a bias direct measurement.

The concrete core samples are discussed in Section 5.5.1. The bias direct measurements performed at grid K10/11, grid K12, and grid K15 and are discussed in Section 5.3.2. The bias direct measurement results were rejected during data validation (see Section 6.1).

5.3.2 SU 7A Alpha/Beta Direct Measurements

Integrated direct measurements (i.e., static measurements) of surface alpha and beta radioactivity were performed during the FSS to compare contaminant concentrations at discrete measurement locations on the pedestal to the surface activity limits listed in Table 3-1 and facilitate statistical testing. A Ludlum Model 2360 data logger and a Ludlum Model 43-37 large area gas proportional detector was used to perform direct measurements at systematic locations. A Ludlum Model 2360 data logger and Ludlum model 43-93 scintillator was used to perform alpha beta direct measurements at bias locations and at four systematic grid locations inaccessible to the Model 43-37 detector (i.e., Grids G3, H3, I3, and J3). Alpha and beta direct measurements were performed at 177 systematic locations on August 27, 2021 with the Model 43-37 detector. Alpha and beta direct measurements were performed at four systematic locations (Grids G3, H3, I3, and J3) and three bias locations identified by the beta surface scan survey (Grids K11, K12, and K15) on September 8, 2021.

Alpha and beta direct measurements in counts were converted to units of disintegrations per minute per 100 square centimeters (dpm/100 cm^2) using the following equation:

$$dpm/100cm^2 = \frac{{}^{C_s}/_{T_s} - {}^{C_b}/_{T_b}}{(\varepsilon_T) \times (A/100)}$$

Where:

C_s = integrated counts recorded by the instrument

C_b = average RBA counts

T_s = time period over which sample counts were recorded (minutes)

T_b = time period over which background counts were recorded (minutes)

ε_T = total efficiency of the instrument (Table 4-3)

A = physical probe area (cm^2)

Table 5-6 summarizes the results of the alpha and beta direct measurements in SU 7A. The systematic direct measurements were performed at the approximate center of each grid shown in Figure 4. The bias direct measurement locations are shown in Figure 7. The results of the alpha and beta direct measurements are provided in Appendix D.

Table 5-6. Alpha and Beta Direct Measurement Results (dpm/100 cm^2)

Measurement	Minimum	Maximum	Mean	Standard Deviation	Median	Number of Measurements
Alpha Systematic	-29	27	-2.9	9.54	-2.8	177
Beta Systematic	-500	157	-7.6	88.4	-15.5	177

Measurement	Minimum	Maximum	Mean	Standard Deviation	Median	Number of Measurements
Alpha Rejected	-8.3	33	8.5	16.1	7.0	7
Beta Rejected	-537	689	-113	413	-187	7

Daily instrument checks were not performed on September 8, 2021. Therefore, the results for the three bias measurements and last four systematic measurements performed using the Model 43-93 detector were rejected and are not usable for evaluating dose. However, the rejected direct measurement results are consistent with the validated direct measurement results. The rejected direct measurement results provide evidence the residual radioactivity at the locations of the rejected measurements is consistent with the residual radioactivity over the rest of SU 7A.

5.3.3 SU 7A Alpha/Beta Smear Measurements

Smear samples were collected during the FSS to evaluate removable alpha and beta activity concentrations against the removable surface activity limits listed in Table 3-1 and facilitate statistical testing. Smear samples were collected at 177 systematic locations on the concrete pedestal on August 27, 2021. A Ludlum Model 2929 sample counter and Ludlum Model 43-10-1 scintillator was used to count the smear samples on the same day they were collected. Alpha and beta removable activity results were converted into units of dpm/100 cm^2 using the equation presented in Section 5.3.2. Table 5-7 summarizes the results of the smear sample results in SU 7A. The smears were collected from the approximate center of each grid shown in Figure 4. The results of the smears sample analysis for removable alpha and beta activity are provided in Appendix D.

Table 5-7. Alpha and Beta Removable Surface Activity Results (dpm/100 cm^2)

Measurement	Minimum	Maximum	Mean	Standard Deviation	Median	Number of Measurements
Alpha Systematic	-0.4	11.4	0.3	1.94	-0.4	176
Beta Systematic	-102	127	-8.1	37.1	-9.8	176

Only 176 smear sample counts were reported. No counts were provided for the smear from grid location P8. Smears were not collected from the 3 bias locations and 4 systematic locations investigated on September 8, 2021. The missing data were not identified until after site renovation was complete and collection of a replacement smear was not possible. The lack of removable activity data for these 8 locations does not result in the investigation of removable activity on the concrete pedestal being incomplete. The surface of the pedestal was newly exposed by cutting approximately 12 inches of concrete from the top of the pedestal. The newly exposed surface had

been power washed to remove any loose material, so the potential presence of removable radioactivity was unlikely. The average removable activity from the 176 smear samples that were collected was approximately zero for both alpha and beta activity. The results from the 8 locations where smears were not collected were expected to be close to zero removable activity as well.

5.3.4 SU 7A Pedestal Drain Investigation

Following removal of the top of the concrete pedestal, and investigation of the pedestal drains was performed. On August 5, 2021 four smear samples were collected from the remaining drains on the pedestal. The results of all four smears samples showed alpha removable activity less than 20 dpm/100 cm^2 and beta removable activity consistent with background. The results of the drain investigation are provided in Appendix D.

5.4 GAMMA WALKOVER SURVEYS

A 100% gamma walkover survey was performed over accessible areas within each survey unit in accordance with MARSSIM guidance for Class 1 areas. The purpose of the gamma walkover survey is to identify areas of elevated gamma radiation for further investigation. The sides of the excavations were too steep and could not be safely accessed on foot. These areas were accessed from a manlift using the same distance between survey rows and height of the detector above the ground surface used for walkover surveys, but with a slower scan speed to ensure 100% coverage.

After completion of the gamma walkover survey, the data were downloaded from the DGPS receiver data/logger into a PC file and entered into a geospatial software program. Each SU data set was processed to calculate the mean and standard deviation, and a z-score was generated for each one-second gamma measurement. The resulting z-scores were presented on a posting plot showing the location of scan results more than three standard deviations above the mean to assist in determining locations for additional investigation.

5.4.1 SU 7A Concrete Pedestal

Gamma walkover surveys were performed on the concrete pedestal surface on August 7, 12, 14, 18, 25, and 30, 2021. The trench cut into the surface of the pedestal during demolition was partly filled with water and inaccessible for gamma walkover measurements. Table 5-8 summarizes the gamma walkover survey results in SU 7A. The posting plot of the z-scores is shown in Figure 5. The results of the gamma walkover survey are provided in Appendix E.

Table 5-8. SU 7A Gamma Walkover Survey Results

Minimum	Maximum	Mean	Standard Deviation (σ)	Mean + 3σ	Number of Measurements
8,040 cpm	25,140 cpm	12,154 cpm	1,418 cpm	16,408 cpm	4,365

The number of gamma walkover survey measurements indicates approximately 30 one-second counts per square meter of surface for the concrete pedestal. The average scan speed was slower than the 0.5 m/sec maximum scan speed specified in the FSP, which would have resulted in 4 to 5 one-second counts per square meter. The gamma walkover survey coverage in SU 7A covered 100% of the accessible area and met the objectives of the FSS.

Two locations with elevated gamma results were identified for additional investigation:

- Grid G3/G4 – maximum gamma walkover reading in small area of elevated activity, and
- Grid I4 – small area of elevated gamma activity.

Concrete core samples collected to investigate these areas of elevated gamma radiation are discussed in Section 5.5.1.

5.4.2 SU 7B Silencer Excavation

Gamma walkover surveys were performed in the Silencer excavation on August 6, 7, 9, 10, 11, 12, 13, 14, 16, 18, 23, 24, 25, and September 1, 2021. There were no areas in SU 7B inaccessible for gamma walkover surveys. Surveys of the north, south, and east excavation walls were performed using the manlift because these areas were not safe to access on foot. Table 5-9 summarizes the gamma walkover survey results in SU 7B. The posting plot of the z-scores is shown in Figure 8. The results of the gamma walkover survey are provided in Appendix E.

Table 5-9. SU 7B Gamma Walkover Survey Results

Minimum	Maximum	Mean	Standard Deviation (σ)	Mean + 3σ	Number of Measurements
5,400 cpm	25,440 cpm	10,435 cpm	1,462 cpm	14,821 cpm	14,149

The number of gamma walkover survey measurements indicates approximately 43 one-second counts per square meter of surface for the Silencer excavation. The average scan speed was slower than the 0.5 m/sec maximum scan speed specified in the FSP, which would have resulted in 4 to 5 one-second counts per square meter. The gamma walkover survey coverage in SU 7B covered 100% of the accessible area and met the objectives of the FSS.

Two locations with elevated gamma results were identified for additional investigation:

- Northeast corner inside the trench box near the former sump location, and
- Maximum gamma walkover result at the top of the south excavation wall.

Bias soil samples collected to investigate these areas of elevated gamma radiation are discussed in Section 5.5.2.

5.4.3 SU 7C Stormwater Collection System

Gamma walkover surveys were performed in SU 7C on August 7, 9, 10, 13, 14, 21, 26, 30, and September 1, 2021. There were no areas in SU 7C inaccessible for gamma walkover surveys. Table 5-10 summarizes the gamma walkover survey results in SU 7C. The posting plot of the z-scores is shown in Figure 10. The results of the gamma walkover survey are provided in Appendix E.

Table 5-10. SU 7C Gamma Walkover Survey Results (cpm)

Minimum	Maximum	Mean	Standard Deviation (σ)	Mean + 3σ	Number of Measurements
6,840 cpm	33,840 cpm	11,168 cpm	1,446 cpm	15,507 cpm	4,888

The number of gamma walkover survey measurements indicates approximately 35 one-second counts per square meter of surface. The average scan speed was slower than the 0.5 m/sec maximum scan speed specified in the FSP, which would have resulted in 4 to 5 one-second counts per square meter. The gamma walkover survey coverage in SU 7C was 100% of the accessible area and met the objectives of the FSS.

Two locations with elevated gamma results were identified for additional investigation:

- South edge of the drainpipe excavation along the north edge of the pedestal, and
- Maximum gamma walkover result near the location of the removed abandoned pipe.

Systematic and bias soil samples collected to investigate these areas of elevated gamma radiation are discussed in Section 5.5.3.

5.4.4 SU 7D Radiation Control Area

Gamma walkover surveys were performed in soil areas in SU 7D on August 6, 7, 9, 10, 11, 12, 13, 14, 18, 20, 21, 23, 24, 25, 26, 30, 31, and September 1, 2021. Gamma walkover surveys were performed on the asphalt surface east of the pedestal on August 9, 2021. A small pumping station at the top of the north wall of the Silencer excavation was inaccessible for gamma walkover survey. The stormwater collection tank excavation south wall east of the pedestal was too steep to scan on foot and was also difficult to access with the manlift. Gamma walkover surveys were not performed in these two inaccessible areas. Table 5-11 summarizes the gamma walkover survey results in SU 7D. The gamma walkover survey results for the soil areas are evaluated separately from the asphalt areas because of the potential for different background activities for the different materials being scanned. The posting plot of the z-scores is shown in Figure 12. The results of the gamma walkover survey are provided in Appendix E.

Table 5-11. SU 7D Gamma Walkover Survey Results (cpm)

Material	Minimum	Maximum	Mean	Standard Deviation (σ)	Mean + 3σ	Number of Measurements
Soil	4,680	18,540	11,506	1,410	15,734	40,812
Asphalt	7,020	14,640	10,085	845	12,621	3,446

The number of gamma walkover survey measurements indicates approximately 20 one-second counts per square meter of surface for the concrete pedestal. The average scan speed was slower than the 0.5 meters per second (m/sec) maximum scan speed specified in the FSP, which would have resulted in 4 to 5 one-second counts per square meter. The gamma walkover survey coverage in SU 7D covered 100% of the accessible area and met the objectives of the FSS.

Two locations with elevated gamma results were identified for additional investigation:

- Near the top of the Silencer excavation west wall, and
- Maximum gamma walkover result along the north side of the RCA outside the Silencer excavation.

Bias soil samples collected to investigate these areas of elevated gamma radiation are discussed in Section 5.5.4.

5.5 SAMPLE COLLECTION AND ANALYSIS

Soil samples were collected using Cabrera operating procedure (OP)-351, Surface Soil Sampling. Soil samples were collected using manual sampling tools; garden trowel, shovel. Surface soil samples were collected from 0 to 6 inches below ground surface, 6 to 12 inches below ground surface, and 18 to 24 inches below ground surface at each systematic and bias location.

Each soil sample was transferred into a 5 gal. bucket, where it was thoroughly mixed to homogenize the sampled media. Visually identifiable non-soil components such as stones, twigs, and foreign objects were manually separated in the field and excluded from the laboratory samples to avoid biasing results. The lead and mercury portion of each sample was cooled to 4 C during packaging and shipping of the samples to the laboratory. All sampling equipment, mixing utensils, and homogenizing bowls were decontaminated as described in Cabrera OP-373, Field Equipment Decontamination.

Concrete samples were collected as described in Cabrera OP-313, Concrete Core Sampling. Concrete samples were obtained using a concrete coring drill. Instead of a single 3-inch diameter core described in the FSP, five 2-inch diameter cores approximately 2-inches deep were co-located at each sample location to provide sufficient sample material to perform all requested laboratory analyses.

Sample containers were marked to show the sample identification number, date, and time the sample was collected, requested analyses, and the initials of the person collecting the sample. Samples were collected in accordance with applicable chain of custody procedures as described in the project UFP-QAPP.

Samples were analyzed for all radionuclides of concern listed in Table 3-1 in accordance with approved analytical procedures provided in the UFP-QAPP (OFJV 2020b). The results of the sample analyses were used to support exposure pathway modeling as described in Section 7.0. Laboratory reports documenting the sample analyses are provided in Appendix A of the Closeout Report and summarized in Appendix C of this report.

5.5.1 SU 7A Concrete Pedestal

Concrete samples were collected from the exposed surface of the pedestal to investigate the potential presence of residual radioactivity from the radionuclides of concern. Concrete samples were collected after total and removable surface activity measurements were completed from six systematic locations on the pedestal.

Five systematic concrete core samples were collected in SU 7A on August 28, 2021. The FSP (OFJV 2020a) specified a sixth systematic concrete core sample would be collected on the slope on the west side of the pedestal. This area was removed during demolition and was not available for sampling.

Two bias concrete core samples were collected on August 28, 2021. One bias sample location (SU7A-B01) was used to investigate the area of maximum gamma activity identified in Grids G3 and G4 by the gamma walkover survey. The second bias location (SU7A-B02) was used to investigate the trench that was inaccessible for gamma walkover survey. Most of the water in the trench was removed to provide access for concrete core sampling.

The locations of the systematic and bias concrete core samples in SU 7A are shown in Figure 7. The results of the concrete core sample analyses are summarized in Section 5.6.

5.5.2 SU 7B Silencer Excavation

Soil samples were collected from the bottom of the Silencer excavation as well as from the north slope, south slope, and east slope of the Silencer excavation to investigate the potential presence of residual radioactivity from the radionuclides of concern.

Soil samples were collected from three sample depths at 16 systematic locations in SU 7B on August 12, 13, 17, and 18, 2021. Soil samples were collected from three sample depths at two bias locations on August 26, 2021. The two bias locations were selected to investigate the two areas of elevated gamma activity identified by the gamma walkover survey.

The locations of the systematic and bias soil samples collected in SU 7B are shown in Figure 9. The results of the soil sample analyses are summarized in Section 5.6.

5.5.3 SU 7C Stormwater Collection System

Soil samples were collected from the bottom of the Stormwater Collection System excavation to investigate the potential presence of residual radioactivity from the radionuclides of concern.

Soil samples were collected from three sample depths at 16 systematic locations in SU 7C on August 18, 19, and 20, 2021. Systematic location SU 7C-S07 was used to investigate the maximum gamma activity result from the gamma walkover survey.

Soil samples were collected from three sample depths at two bias locations on August 26, 2021. One bias location was selected to investigate the elevated gamma results from the gamma walkover survey along the north edge of the pedestal. The second bias location was selected to investigate the next highest reading from the gamma walkover survey.

The locations of the systematic and bias soil samples collected in SU 7C are shown in Figure 11. The results of the soil sample analyses are summarized in Section 5.6.

5.5.4 SU 7D Radiation Control Area

Soil samples were collected from the remaining impacted areas inside the RCA to investigate the potential presence of residual radioactivity from the radionuclides of concern.

Soil and asphalt samples were collected from two systematic locations and two bias locations in the asphalt covered area east of pedestal on August 11, 2021. Samples of the asphalt were removed to provide access to the underlying soil. A sample of asphalt and three soil samples from separate depth intervals were collected at each location. The two bias locations were identified based on professional judgment to provide sufficient data to describe radiological conditions in the asphalt area.

Soil samples were collected from three sample depths at the remaining 14 systematic locations in SU 7D on August 24, 25, and 26, 2021. A solid object was encountered between 12 and 18 inches below ground surface at systematic location SU 7D-S14 southwest of the pedestal that prevented collecting a soil sample from the 18 to 24-inch depth interval. Systematic location SU 7D-S07 was collected in the area south of the stormwater collection tank excavation inaccessible for gamma walkover surveys.

Soil samples were collected from three sample depths at three bias locations on August 24, 26, and September 2, 2021. Two bias locations were selected to investigate the two areas of elevated gamma activity identified by the gamma walkover survey (Section 5.4.4). The final bias location was selected to investigate the pea gravel surrounding the stormwater collection tank to investigate the potential for residual radioactivity from the tank to be present in soils outside the trench box.

The locations of the systematic and bias soil samples collected in SU 7D are shown in Figure 13. The results of the soil sample analyses are summarized in Section 5.6.

5.6 SUMMARY OF SAMPLE ANALYTICAL RESULTS

Soil and concrete samples were analyzed for the radionuclides of concern listed in Table 3-1 in accordance with approved analytical procedures provided in the UFP-QAPP (OFJV 2020b). Summary statistics for the radionuclides of concern from the HFBR ROD (BNL 2009) are provided in Table 5-12 for Sr-90, Table 5-13 for Cs-137, and Table 5-14 for Ra-226. Table 5-15 provides summary statistics for H-3, which was detected throughout SU 7A. Table 5-16 provides summary statistics for U-238, which was detected in almost every sample analyzed. Not all radionuclides were detected in every SU. Analytical results for all radionuclides of concern are provided in Appendix C.

Table 5-12. Summary Statistics for Sr-90 Analytical Results (pCi/g)

SU	Minimum	Maximum	Mean	Median	Standard Deviation	Number of Measurements
SU 7A	-0.0317	7.52	1.642	0.372	2.786	7
SU 7B	-0.179	0.616	0.169	0.16	0.167	54
SU 7C	-0.173	0.567	0.071	0.0675	0.152	54
SU 7D	-0.193	0.48	0.0994	0.0825	0.143	66

Table 5-13. Summary Statistics for Cs-137 Analytical Results (pCi/g)

SU	Minimum	Maximum	Mean	Median	Standard Deviation	Number of Measurements
SU 7A	-0.0529	4.05	0.667	0.00207	1.515	7

6.0 FINAL STATUS SURVEY DATA EVALUATION

The evaluation of FSS data was performed as described in the FSP (OFJV 2020a) and included:

- Data validation (Section 6.1),
- Review of DQOs (Section 3.3),
- Preliminary data review using exploratory data analysis (Section 6.2),
- Direct comparison with cleanup goals (Section 6.3), and
- Statistical tests (Section 6.4).

6.1 RADIOLOGICAL DATA VALIDATION

Data validation of analytical laboratory results was performed using the requirements listed in the UFP-QAPP (OFJV 2020b) and the Consolidated Quality Systems Manual (QSM, DoD/DOE 2018).

Radionuclides that were not detected were qualified with a "U" flag by the analytical laboratory. All results assigned a "U" flag by the laboratory were maintained during data validation. No additional "U" flags were assigned during data validation to identify radionuclides that were not detected. Initial laboratory reports (see Closeout Report Appendix A) include "U" flags assigned based on the minimum detectable concentration instead of the critical level. Revised electronic data deliverables were provided with "U" flags assigned based on the critical level as described in a letter from the laboratory provided in Appendix F. Analytical data assigned a "U" flag represent a normal usable result.

A "Q" flag was assigned during data validation to analytical results where the combined standard uncertainty exceeded the FSS project objectives. The most common cause for assignment of a "Q" flag was an instrument background or source check outside control limits either before or after a measurement was performed. A "Q" flag was also assigned to a batch of results if the laboratory control sample (LCS) recovery was outside acceptable limits. Analytical data assigned a "Q" flag represent a usable result.

A "J" flag was assigned during data validation to analytical results that are unusually uncertain or estimated. The most common cause for assignment of a "J" flag was a carrier or tracer recovery outside acceptable limits. Analytical data assigned a "J" flag represent a usable result.

A "B" flag was assigned during data validation to analytical results associated with a blank result outside acceptable limits. The most common cause for assignment of a "B" flag was a method blank (MB) greater than three times the reported total uncertainty. Analytical data assigned a "B" flag represent a usable result.

A "R" flag assigned during data validation indicates quantitative or qualitative problems so severe the data are rejected and cannot be used for their intended purpose. No laboratory analytical data were assigned an "R" flag.

Data validation was also performed on field data, including gamma walkover survey data, alpha and beta direct measurements, and alpha and beta smear measurements. Validation of field data did not include assignment of flags. All field data collected during the FSS were determined to be usable except eight direct measurements performed using the Ludlum 43-93 on September 8, 2021. While these results could not be used for the intended purpose of demonstrating compliance with the project cleanup criteria, the results f the measurements still supported the conclusions drawn from the FSS. The data validation report is provided in Appendix F.

6.2 EXPLORATORY DATA ANALYSIS

Exploratory data analysis is a process of reviewing data to learn about the structure of the data by identifying patterns, relationships, or potential anomalies. The exploratory data analysis performed on the FSS data included calculation of statistical quantities, a graphical data review to assist in visually identifying patterns or anomalies, and statistical tests to formally compare survey data against a specific criterion.

Exploratory data analysis begins by dividing the available data into data sets of comparable information for evaluation. MARSSIM states that FSS decisions are made for each SU, so all data are divided by SU whenever possible. Separate data sets were identified for each type of field measurement for each applicable SU, including gamma scan, beta scan, alpha direct, beta direct, alpha smear, and beta smear. In addition, a separate data set was developed for each radionuclide of concern for each SU. Each data set was evaluated separately.

Summary statistics were calculated for each data set. At a minimum, summary statistics included the mean, median, standard deviation, minimum, and maximum value. For laboratory analytical data sets where at least one result represented a detected value (i.e., at least one value did not receive a "U" flag from data validation) the 95% UCL was calculated for the data set for use in calculating dose estimates (see Section 7.0). Laboratory analytical data sets for radionuclides of concern listed in the HFBR ROD (BNL 2009) including Sr-90, Cs-137, and Ra-226, or naturally occurring radionuclides of concern including U-235 and U-238 had BTVs calculated. BTVs represents the largest concentration of a radionuclide that is consistent with background.

The results of the exploratory data analysis, including graphical representations of different data sets, are provided in Appendix G.

6.2.1 Concrete Reference Background Area

Core samples from the concrete RBA were analyzed for Sr-90, Cs-137, Ra-226, U-235, and U-238. The review of the graphical representations of the concrete RBA data showed all radionuclides of concern produced symmetrical data sets and no outliers were identified for any radionuclide. The range of activities for naturally occurring radionuclides in the RBA were consistent with the range of concentrations for natural background provided in Appendix B of MARSAME (EPA 2009). The results of the concrete RBA sample analyses are provided in Appendix C.

The concrete RBA was also used to provide alpha and beta background data for direct measurements on the concrete pedestal. The alpha and beta direct measurement counts in the RBA appear to be normally distributed. An evaluation of the direct measurement results from SU 7A indicates approximately half the direct measurement results for alpha and beta activity are above zero, while the other half are below zero. This indicates the concrete RBA is reasonably consistent with the background activity associated with the concrete pedestal. The results of the RBA direct measurements are provided in Appendix D.

6.2.2 Soil Reference Background Area

Surface soil samples from the soil RBA were analyzed for Sr-90, Cs-137, Ra-226, U-235, and U-238. The review of the graphical representations of the concrete RBA data showed all radionuclides of concern produced symmetrical data sets and no outliers were identified for any radionuclide. The range of activities for naturally occurring radionuclides in the RBA were consistent with the range of concentrations for natural background provided in Appendix B of

MARSAME (EPA 2009). The results of the soil RBA sample analyses are provided in Appendix C.

6.2.3 SU 7A Concrete Pedestal

The results of the exploratory data analysis for SU 7A identified elevated results for H-3, Sr-90, and Cs-137. Analytical results for Ra-226, U-235, and U-238 were consistent with the RBA results. One sample reported Co-60 as detected, but the concentration was not significantly greater than the results reported as not detected. Analytical results for all other radionuclides of concern were reported as not detected. The maximum sum of fractions result was 1.29 for sample FSS-171-082821 collected from location SU7A-B01 with the highest gamma walkover survey result on the pedestal. The next highest sum of fractions value was 0.49 for FSS-172-082821 collected from the bottom of the trench. Tables of analytical results for samples collected in SU 7A are provided in Appendix C.

A beta scan survey of surface activity was performed over accessible areas of the pedestal. The trench contained several inches of water and was inaccessible for beta scan measurements. The slope on the western edge of the pedestal led to a drop off with no safety railing, so the slope on the western edge of the pedestal was inaccessible for beta scan measurements for safety reasons. The review of the graphical representations of the beta scan data showed the beta surface scan results produced a symmetrical data set with a limited number of outliers. Outliers were investigated using concrete core samples or bias direct measurements.

Direct measurements were performed at systematic and bias locations for alpha and beta activity. The review of the graphical representations of the alpha and beta direct measurement results showed the alpha and beta surface activity results produced symmetrical data sets with no significant outliers. The bias direct measurement results were rejected because the instrument quality control performance checks were not performed the day the data were collected. The rejected direct measurement data were not usable for evaluation of dose or compliance with project cleanup goals, but the rejected data were consistent with other direct measurement results collected as part of the FSS. The results of all alpha and beta direct measurements are provided in Appendix D.

Smear samples were collected from systematic locations where direct measurements were performed and counted for removable alpha and beta activity. The review of the graphical representations of the smear sample results produced symmetrical data sets with no significant outliers. The results of the smear sample analyses for alpha and beta removable activity are provided in Appendix D.

6.2.4 SU 7B Silencer Excavation

The laboratory analytical results showed Ra-226, U-234, and U-238 were detected in more than 75% of the samples collected. The review of the graphical representations of the SU 7B soil sample results produced symmetrical data sets consistent with the RBA results for these radionuclides. Cs-137 was detected in approximately one third of the samples, including all three sample depths at both soil bias sample locations. One sample was identified as an outlier for both H-3 and Ni-63. Sample FSS-046-081721 was collected from 18 to 24 inches below ground surface at systematic location SU 7B-S02. This sample location was in the northwest corner inside the trench box at the deepest part of the Silencer excavation. There were no other outliers or significant detections of radioactivity in SU 7B. The highest sum of fractions value was 0.70 for sample FSS-156-082621. This sample was collected from 0 to 6 inches below ground surface at the bias location inside the

trench box identified based on the gamma walkover survey results, SU 7B-B01. The results of the soil sample laboratory analyses are provided in Appendix C.

6.2.5 SU 7C Stormwater Collection System

The laboratory analytical results showed Ra-226, U-234, and U-238 were detected in more than 85% of the samples collected. The review of the graphical representations of the SU 7C soil sample results produced symmetrical data sets consistent with the RBA results for these radionuclides. Cs-137 was detected in approximately one third of the samples. There were no outliers or significant detections of radioactivity in SU 7C. The highest sum of fractions value was 0.29 and occurred in two soil samples, as follows: Sample FSS-093-081921 was collected from systematic location SU 7C-S08 at 18 to 24 inches below ground surface. Sample FSS-168-082621 was collected from bias location SU 7C-B02 at 0 to 6 inches below ground surface. The results of the soil sample laboratory analyses are provided in Appendix C.

6.2.6 SU 7D Radiation Control Area

The laboratory analytical results showed Ra-226, U-234, and U-238 were detected in more than 90% of the samples collected. The review of the graphical representations of the SU 7D soil sample results produced symmetrical data sets consistent with the RBA results for these radionuclides. Cs-137 was detected in approximately one third of the samples. There were no outliers or significant detections of radioactivity in SU 7D. The highest sum of fractions value was 0.37 and occurred in two soil samples collected from the location near the top of the west wall of the Silencer excavation based on the gamma walkover survey results, as follows: Sample FSS-178-090221 was collected from 0 to 6 inches below ground surface, and sample FSS-179-090221 was collected from 6 to 12 inches below ground surface at bias location SU 7D-B02. The results of the soil sample laboratory analyses are provided in Appendix C.

6.3 DIRECT COMPARISON

The direct comparison evaluates each result against the corresponding cleanup goal listed in Table 3-1 to identify areas of contamination requiring additional investigation or explanation. The only result from the FSS that exceeded the 10 mrem/y ALARA cleanup goal was the sum of fractions for the concrete core sample collected from the area of elevated activity on the pedestal with a value of 1.28 compared with a cleanup goal of 1.0 (Sample FSS-171-082821, location SU 7A-B01). The sum of fractions for this sample based on the 15 mrem/yr cleanup goals from the HFBR ROD was 0.85 and demonstrated compliance with the ROD values. No individual analytical result for a radionuclide of concern exceeded the corresponding cleanup goal based on the 10 mrem/yr ALARA limit listed in Table 3-1. No direct measurement result or removable activity result exceeded the corresponding cleanup goal based on the BNL Radiological Control Manual (BNL 2020) surface contamination values for unrestricted release of material, equipment, and property. Tritium associated with the concrete pedestal was evaluated based on dose estimated from volumetric samples and was not considered as part of the evaluation of surface contamination.

6.4 STATISTICAL TESTS

The FSP specifies using the WRS statistical test to compare SU data sets with RBA data sets. The purpose of the test is to determine if the residual radioactivity in the SU exceeds the RBA activity by more than the cleanup goal. The test is applied to the sum of fraction values based on the

analytical results for radionuclides of concern with radionuclide-specific dose based cleanup goals corresponding with the 10 mrem/yr ALARA goal.

MARSSIM Table 8.2 states the results of the WRS test will show the SU obviously meet the release criterion (or cleanup goal) if the difference between the largest survey unit measurement and the smallest reference area measurement is less than the cleanup goal. The smallest RBA sum of fraction result cannot be less than 0. All sum of fraction values for systematic sample results from SU 7A, SU 7B, SU 7C, and SU 7D are less than 1.0 so all four SUs demonstrated compliance with the 10 mrem/yr ALARA goal, and the WRS test results are not required. A retrospective power curve was constructed for SU 7A to determine if the limited number of systematic samples was sufficient to support a decision concerning the radiological status of the concrete pedestal. The retrospective power for the 5 systematic samples collected in SU 7A and the 6 concrete RBA samples was 1.0 and exceeded the planned power of 0.95.

For SU 7A, the maximum sum of fractions at a bias location is 1.28, and the minimum sum of fractions for the concrete RBA added to the cleanup goal of 1.0 is 1.09. The WRS test was performed to determine if the sum of fractions values for all FSS samples collected in SU 7A exceed the sum of fraction values for the RBA by more than 1.0.

The WRS test was performed using all seven sum of fraction results from SU 7A, including the two bias results. The critical value for the WRS test is 54, and the test statistic (i.e., the sum of the Reference Area ranks) from the WRS test is 57. Since the test statistic exceeds the critical value, the null hypothesis that assumes the SU exceeded the cleanup goal was rejected. The retrospective power for the WRS test was calculated as 0.76, which is less than the planned power of 0.95. The decrease in power results from the increased standard deviation associated with the SU sum of fraction values and the conservative step of including biased results in the WRS Test.

The results of the WRS test and the retrospective power curves are provided in Appendix G.

7.0 EXPOSURE PATHWAY MODELING

Dose estimates were calculated using the Residual Radioactivity (RESRAD) exposure pathway model, Version 7.2.

7.1 EXPOSURE SCENARIOS AND PATHWAYS

Two exposure scenarios were used to evaluate the FSS results against the HFBR ROD requirements, an industrial worker scenario and a residential scenario.

The industrial worker scenario applies to an industrial worker with no decay time (Year=0) and covers current workers at the site. The exposure pathways considered as part of the industrial scenario include exposure to external radiation, inhalation of airborne radioactivity, soil ingestion, and drinking water ingestion.

The residential scenario applies to non-farmer future residents following 50 years of institutional controls by DOE (Year=50) and covers potential future occupants of the site. The exposure pathways considered as part of the residential scenario include the same pathways evaluated for the industrial worker scenario: exposure to external radiation, inhalation of airborne radioactivity, soil ingestion, and drinking water ingestion. In addition, the non-farmer resident scenario includes a plant ingestion pathway.

Both the residential and industrial scenarios were used to calculate a dose for each SU. In addition, bias concrete sample SU7A-B01 was modeled as an area of elevated activity. The elevated area model conservatively assumed the activity from the bias sample was uniformly distributed throughout the entire concrete pedestal and approximately 2.5 meters of soil beneath the pedestal. The actual area of elevated activity associated with sample SU7A-B01 appears to be approximately one square meter or less based on the gamma walkover survey (Figure 5) and the beta scan survey (Figure 6). The results of the pre-demolition characterization and measurements performed during the remedial activities on the pedestal indicated the concentrations of residual radioactivity decreased with depth. The residual radioactivity identified during remedial activities also appeared to be associated with preferential migration pathways provided by small cracks in the concrete pedestal so the assumption of uniform distribution over a larger volume would be conservative.

All scenarios consider ingestion of groundwater with a dose limit of 4 mrem/yr from the water ingestion pathway.

7.2 SELECTION OF MODEL PARAMETERS

Previous investigations of the HFBR and AOC 31 included exposure pathway modeling using RESRAD Version 6.5 (BNL 2011a, BNL 2011b, BNL 2012). Model parameter values for this FSSR were selected to match the previous modeling as closely as possible. Model parameters not specifically mentioned in the following sections used the RESRAD default values.

Portions of the concrete pedestal will remain in place, and the criteria for cleanup was the same as that for soil (see Table 3-1). The radionuclides in concrete are expected to be at least as tightly bound to the concrete as the radionuclides in soil; therefore, the release of radioactive materials from concrete will be similar (or slower) than that from soil (BNL 2010). The same modeling parameters were used for concrete and soil.

7.2.1 Dose Conversion Factor

Dose conversion factors used for calculating dose were taken from Federal Guidance Report No. 11 (EPA 1988) and Federal Guidance Report No. 12 (EPA 1993).

7.2.2 Radionuclide Concentration

Radionuclide concentrations were developed for each SU based on the reported analytical laboratory results. A radionuclide of concern was included if at least one sample collected from that SU detected that radionuclide at a concentration exceeding background. The RBA average values were calculated for naturally occurring radionuclides of concern Ra-226, U-235, and U-238. The RBA average values were subtracted from the SU values for naturally occurring radionuclides for each naturally occurring radionuclide of concern. The 95% upper confidence level of the mean (95% UCL) was calculated for each detected radionuclide for each SU using all sample results for that SU, even results identified as not detected and samples collected from bias locations. The 95% UCL calculations accounted for the presence of results identified as not detected. If less than four results in a data set were identified as detected (i.e., did not receive a "U" flag during data validation) the median of the reported values was assigned as the 95% UCL.

The 95% UCL was used as the modeled concentration for each detected radionuclide. EPA's ProUCL software, Version 5.1, was used to calculate all 95% UCL values. Table 7-1 lists the radionuclide of concern concentrations used in the RESRAD model calculations for each SU. The concentration in Table 7-1 is assumed to be uniformly distributed throughout the SU to a depth of 5 meters.

Table 7-1. Radionuclide Concentrations Used in RESRAD Modeling

Radionuclide of Concern	SU 7A 95% UCL (pCi/g)	SU 7B 95% UCL (pCi/g)	SU 7C 95% UCL (pCi/g)	SU 7D 95% UCL (pCi/g)
H-3	261.1	2.298	0	-0.133
C-14	1.036	-0.222	-0.0221	-0.4
Na-22	ND	0.0193	-0.0388	-.037
Co-60	0.015	-0.0304	-0.033	-.0278
Ni-63	0.54	3.48	0.625	0.398
Sr-90	3.812	0.183	-0.00938	-0.0119
Cs-137	0.00207	0.0867	0.0499	0.206
Eu-152	0.0924	0.0749	0.0278	0.147
Eu-154	0.0533	0.0384	0.0456	0.101
Eu-155	ND	0.0106	ND	ND
Ra-226	0.23	-0.0189	-0.179	0.0215

Radionuclide of Concern	SU 7A 95% UCL (pCi/g)	SU 7B 95% UCL (pCi/g)	SU 7C 95% UCL (pCi/g)	SU 7D 95% UCL (pCi/g)
U-234	0.0368	-0.155	-0.155	-0.0699
U-235	0.0153	-0.0246	0.0139	-0.00977
U-238	0.0368	-0.125	-0.153	-0.097
Pu-238	-0.00629	-0.0934	-0.0206	-0.0323
Pu-239	-0.00121	-0.0164	-0.0195	-0.0172
Pu-241	ND	-3.283	0.154	-3.105
Am-241	ND	0.0329	0.0167	-0.025

ND = Not Detected by the Analytical Laboratory, not included in dose calculation

SU 95% UCL concentration less than zero not included in dose calculation

The summary statistics for the soil and concrete RBAs are listed in Table 5-2 and Table 5-3, respectively. The only radionuclides of concern adjusted for background using the RBA data are naturally occurring and are limited to Ra-226, U-234 (assumed to be in secular equilibrium with U-238), U-235, and U-238.

Sample 7A-B01 (FSS-171-082821) resulted in a SOR greater than 1.0 based on the ALARA cleanup goals for Sr-90 and Cs-137 listed in Table 3-1. The dose associated with the detected concentrations for this samples was calculated using RESRAD assuming the concentrations were uniformly distributed throughout SU 7A. Tritium (41.2 pCi/g), C-14 (1.16 pCi/g), Ni-63 (1.01 pCi/g), Sr-90 (7.52 pCi/g), Cs-137 (4.05 pCi/g), Eu-154 (0.0801 pCi/g), Ra-226 (0.272 pCi/g above the RBA), U-235 (0.0008 pCi/g above the RBA), and U-238 (0.059 pCi/g above the RBA) were the radionuclides detected by the analytical laboratory that also exceeded the RBA values.

7.2.3 Distribution Coefficient

The distribution coefficient, K_d, is the ratio of the mass of solute species adsorbed or precipitated on the solids per unit of dry mass of the soil, S, to the solute concentration in the liquids, C. The distribution coefficient represents the partition of the solute in the soil matrix and soil water, assuming that equilibrium conditions exist between the soil and solution phases. This parameter is a chemical characteristic specific to each element.

The K_d values recommended for use in RESRAD (ANL 2015) are based on soil type. The soil type encountered during D&D of the HFBR Stack based on visual observation of the material present in the excavation is sandy soil. The K_d values selected for the dose calculations are the lower (i.e., more conservative, result in higher concentrations in groundwater and increased mobility) value of the value recommended for sandy soil (Table 2.13.9 in ANL 2015) and the default K_d value used in RESRAD (Table 2.13.10 in ANL 2015). Table 7-2 lists the K_d values used to calculate doses using RESRAD.

Table 7-2. Selected Distribution Coefficient (K_d) Values

Element	K_d Value (cm^3/g)	Source	Element	K_d Value (cm^3/g)	Source
Americium	20	Default	Nickel	130	Sand
Carbon	0	Default	Plutonium	400	Sand
Cesium	530	Sand	Radium	70	Default
Cobalt	260	Sand	Strontium	22	Sand
Europium	825	Default	Uranium	50	Default
Hydrogen	0	Default			

7.2.4 Site-Specific Parameter Values

Site-specific parameter values describe environmental conditions and physical characteristics specific to BNL. All site-specific parameter values were taken from RESRAD model inputs used to calculate dose for previous projects associated with the HFBR and AOC 31 (BNL 2011a, BNL 2011b, BNL 2012). Site-specific parameter values are listed in Table 7-3. The area of the contaminated zone is modeled as the actual survey unit area. The length parallel to aquifer flow is modeled as the square root of the actual area.

Table 7-3. Site-Specific Parameter Values

Parameter Name	Site-Specific	RESRAD Default
Area of Contaminated Zone (m^2)	SU 7A = 146 SU 7B = 327 SU 7C = 138 SU 7D = 1,543	10,000
Thickness of Contaminated Zone (m)	5	2
Length Parallel to Aquifer Flow (m)	SU 7A = 12 SU 7B = 18 SU 7C = 12 SU 7D = 39	100
Contaminated Zone Density (g/cm^3)	1.66	1.5
Contaminated Zone Total Porosity	0.33	0.4
Contaminated Zone Field Capacity	0.24	0.2
Contaminated Zone Hydraulic Conductivity (m/yr)	5,000	10
Contaminated Zone b Parameter	4.9	5.3
Average Annual Wind Speed (m/sec)	6.23	2

Parameter Name	Site-Specific	RESRAD Default
Evapotranspiration Coefficient	0.46	0.5
Precipitation (m/yr)	1.23	1
Irrigation (m/yr)	0.26	0.2
Saturated Zone Density	1.66	1.5
Saturated Zone Total Porosity	0.33	0.4
Saturated Zone Effective Porosity	0.24	0.2
Saturated Zone Hydraulic Conductivity (m/yr)	20,000	100
Saturated Zone b Parameter	4.9	5.3
Well Pump Intake Depth (m)	18	10
Hydraulic Gradient	0.0048	0.02
Unsaturated Zone Thickness (m)	0	4
Unsaturated Zone Density (g/cm^3)	1.66	1.5
Unsaturated Zone Total Porosity	0.33	0.4
Unsaturated Zone Effective Porosity	0.24	0.2
Unsaturated Zone b Parameter	4.9	5.3
Unsaturated Zone Hydraulic Conductivity (m/yr)	5,000	100
Inhalation rate (m^3/yr)	7,300	8,400
Shielding Factor, External Gamma	0.8	0.7
Soil Ingestion Rate (g/yr)	43.8	36.5
Drinking Water Intake (L/yr)	700	510
Mass Loading for Foliar Deposition (g/m^3)	1E-5	1E-4

7.3 MODELING RESULTS

The results of the RESRAD modeling to calculate dose for the industrial scenario (Year=0) and the residential scenario (Year=50) are listed in Table 7-4. The results are shown for each SU and for the area of elevated activity associated with sample SU 7A-B01 (FSS-171-082821).

Table 7-4. Results of Dose Calculations

Survey Unit	Scenario	Dose (mrem/yr)	Water Ingestion Dose (mrem/yr)
SU 7A	Industrial (Year=0)	2.4	0.26
	Residential (Year=50)	2.4	0.13
SU 7B	Industrial (Year=0)	0.75	0.0063
	Residential (Year=50)	0.17	0.023
SU 7C	Industrial (Year=0)	0.40	0.0073
	Residential (Year=50)	0.13	0.048
SU 7D	Industrial (Year=0)	1.6	0.00019
	Residential (Year=50)	0.57	0.019
SU 7A-B01*	Industrial (Year=0)	9.3	0.086
	Residential (Year=50)	5.5	0.12

* The dose calculation based on the small area of elevated activity at bias sample location SU7A-B01 on the concrete pedestal includes the conservative assumption the entire volume of the pedestal and approximately 2.5 meters of soil beneath the pedestal are uniformly contaminated at the concentrations measured in the bias sample.

The maximum projected dose to an industrial worker with no decay time (Year=0) is 9.3 mrem/yr for the elevated reading on the concrete pedestal. The maximum projected dose to a non-farmer resident after 50 years of institutional controls is 5.5 mrem/yr for the elevated reading on the concrete pedestal. The results of the RESRAD model outputs are provided in Appendix H.

All results of the dose assessment are below the dose objective of 15 mrem/yr established in the HFBR ROD. Furthermore, all results of the dose assessment are also below the ALARA goal of 10 mrem/yr. Finally, all results of the dose assessment are below the drinking water limit of 4 mrem/yr for the water ingestion pathway. Groundwater is the only source of drinking water considered in these dose calculations so the objective to evaluate the groundwater pathways has been achieved.

8.0 CONCLUSIONS AND RECOMMENDATIONS

8.1 CONCLUSIONS

Survey data collection activities were performed in a controlled, deliberate manner by trained individuals with calibrated instruments following written procedures and protocols. Data were recorded and reviewed, and documentation provided for review. Instrumentation capable of detecting the radiation types and energies of interest at the required MDCs were selected, calibrated, and maintained for survey data collection.

The maximum projected dose to an industrial worker with no decay time (Year=0) is 9.3 mrem/yr for the elevated reading on the concrete pedestal. The maximum projected dose to a non-farmer resident after 50 years of institutional controls is 5.5 mrem/yr for the elevated reading on the concrete pedestal.

All results of the dose assessment are below the dose objective of 15 mrem/yr established in the HFBR ROD. Furthermore, all results of the dose assessment are also below the ALARA goal of 10 mrem/yr. Finally, all results of the dose assessment are below the drinking water limit of 4 mrem/yr for the water ingestion pathway.

The surface of the concrete pedestal was evaluated against the criteria for the radionuclides of concern specified in the HFBR ROD (BNL 2009); Sr-90, Cs-137, and Ra-226. The direct measurements of alpha and beta surface activity performed on the concrete pedestal are below the surface contamination limits provided for these radionuclides in Table 3-1. The smear sample measurements of removable alpha and beta surface radioactivity associated with the concrete pedestal, including the embedded drain lines, are below the removable activity limits for these radionuclides listed in Table 3-1. The residual alpha and beta surface contamination associated with the concrete pedestal for these radionuclides of concern are below the BNL Radiological Control Manual (BNL 2020) surface contamination values used for unrestricted release of material, equipment, and property in accordance with DOE Order 458.1 (DOE 2020). Other radionuclides of concern listed in Table 3-1, including H-3 and Ni-63, were evaluated against the HFBR ROD criteria as part of the dose modeling.

8.2 RECOMMENDATIONS

The concrete pedestal and surrounding soil areas demonstrate compliance with the HFBR ROD (BNL 2009) requirements. The concrete pedestal also demonstrates compliance with surface contamination values for unrestricted release of material, equipment, and property in accordance with DOE Order 458.1 (DOE 2020). All areas are recommended to have 50 years of industrial use with institutional controls, followed by unrestricted use of the area.

9.0 INDEPENDENT VERIFICATION SURVEY

An independent verification survey was performed to generate radiological data for assessment and evaluation of the accuracy and adequacy of FSS design, implementation, and results for demonstrating compliance with the HFBR ROD requirements. The radiological independent verification contractor was provided with the FSS results to carry out an independent verification survey. The independent verification contractor was provided an opportunity to witness the FSS and sample collection activities. The independent verification contractor performed independent field measurements and collected independent samples to assist in the evaluation of the FSS results to verify the radiological status of the property.

9.1 INDEPENDENT VERIFICATION SURVEY RESULTS

The results of the independent verification survey identified H-3 activity throughout the concrete pedestal and recommended performing a dose assessment to account for the presence of radionuclides without a pre-authorized cleanup goal. The results of the FSS dose assessment including all detected radionuclides of concern are presented in Section 7.0.

In addition, the independent verification survey identified two locations on the concrete pedestal with sums of fractions exceeding unity (i.e., greater than 1.0). The verification contractor did not have access to area factors to perform an elevated measurement comparison. The FSS dose assessment presented in Section 7.0 conservatively assumes the FSS bias concrete sample with a sum of fractions exceeding unity (SU7A-B01) is uniformly distributed throughout the concrete pedestal and underlying soil (Section 7.1 and Table 7-4). Demonstrating compliance with the release criterion of 15 mrem/yr when the maximum concentration is used to represent the average concentration demonstrates additional areas of elevated activity are not likely to result in a dose that exceeds the release criterion.

9.2 SUPPLEMENTAL DOSE CALCULATION

Additional dose calculations were performed for SU 7A to evaluate contributions to total dose that included the results of the independent verification survey concrete sampling. The additional dose calculations were performed using a combined data set that included seven concrete samples collected during the FSS (five systematic and two bias) and three concrete samples collected during the independent verification survey (three bias).

The first set of dose calculations were based on results for all ten samples included in the combined data set. The 95% UCL values were calculated for each radionuclide with at least one sample that reported detected activity (i.e., H-3, C-14, Co-60, Ni-63, Sr-90, Cs-137, Eu-152, Eu-154, Ra-226, U-235, U-238). The activity was uniformly distributed through the entire concrete pedestal and 2.5 m of soil beneath the pedestal. The dose calculations were performed for the industrial and residential scenarios described in Section 7.1. The results of the dose calculations for the combined data set are presented in Table 9-1 and the RESRAD outputs are included in Appendix H. The results of these dose calculations are below the 15 mrem/yr dose limit from the HFBR ROD (BNL, 2009).

Table 9-1. Dose Calculations for the Combined FSS and Independent Verification Data Set

Data Set	Area	Industrial Scenario (Year=0)	Residential Scenario (Year=50)
Combine Data Set	146 m^2	13.4	9.2

A second set of dose calculations were performed using the combined data set from the FSS and independent verification survey. This set of calculations represent an elevated measurement comparison. An area of elevated activity was assigned to each sample reporting an elevated result, and the remaining sample results were used to calculate the average activity for the entire concrete pedestal. The dose associated with each area of elevated activity was added to the average dose for the entire concrete pedestal to estimate the total dose associated with the pedestal.

The determination a sample reported elevated results was based on the sum of fractions calculated based on the 10 mrem/yr ALARA goals listed in Table 3.1. A sample with a sum of fractions greater than unity (greater than 1.0) was identified as a sample reporting elevated activity. Three concrete samples were identified as reporting elevated results:

- FSS bias sample FSS-171-082821 (location SU7A-B01) with a sum of fractions of 1.29,
- Independent verification sample 5356M0001 with a sum of fractions of 1.14, and
- Independent verification sample 5356M0003 with a sum of fractions of 4.71.

The results of the gamma walkover survey shown in Figure 5 were used to assign a maximum area for each sample reporting elevated activity. Figure 5 shows two areas of elevated gamma activity in Grid I4 and between grids G3 and G4. The 3-foot by 3-foot grid overlaying the pedestal in Figure 5 clearly shows all areas of elevated gamma activity on the concrete pedestal have areas less than 1 square meter. The systematic beta direct measurements performed in each grid also support the determination areas of elevated beta activity could not be greater than 1 square meter. An area of 1 square meter was assigned to each of the three areas of elevated activity. The reported activity for each detected radionuclide of concern was uniformly distributed over one square meter to a depth of two meters, approximately the entire thickness of the concrete pedestal.

The remaining seven concrete samples with sums of fractions less than unity were used to evaluate the average dose for the concrete pedestal. The 95% UCL values were calculated for each radionuclide with at least one sample that reported detected activity. The activity was uniformly distributed through the entire concrete pedestal and 2.5 m of soil beneath the pedestal.

The results of the dose calculations for the average pedestal activity and each of the three areas of elevated activity are presented in Table 9-2, along with the total dose for the entire pedestal. The RESRAD output files are provided in Appendix H of this FSSR. The results of these dose calculations are below the 15 mrem/yr dose limit from the HFBR ROD (BNL, 2009).

Table 9-2. Dose Calculations Including Small Areas of Elevated Activity

Data Set	Area	Industrial Scenario (Year=0)	Residential Scenario (Year=50)
Average Activity	146 m^2	2.1	1.7
FSS-171-082821	1 m^2	1.2	0.47
5356M0001	1 m^2	1.2	0.48
5356M0003	1 m^2	4.2	1.4
Total		8.7	4.0

All dose calculations based on independent verification survey data combined with FSS data are less than 15 mrem/yr and demonstrate compliance with the requirements of the HFBR ROD (BNL 2009). Conservative assumptions were incorporated into multiple calculation approaches and scenarios to provide a reasonable upper bound on total dose associated with the concrete pedestal.

Recommended HV (VDC) 1625 Pot. Setting

Additional Comments: Recommended HV = 1625 Per the Ludlum Report 1999 a 25 volt increase in HV is recommended for each 1000-foot decrease in elevation from calibration location. ERG is at 5200-feet HV should be adjusted to +750 (+125V) for elevation change.

Alpha Source: Th-230 sn 4098-80 (3.800dpm/6.53cpm) (~4121.47mm dist.) Total Efficiency: 0.098 4π Efficiency: 0.184

Beta Source: Tc-99 sn 4098-63 (17,500dpm/13.83cpm) (~4121.47mm dist.) Total Efficiency: 0.095 4π Efficiency: 0.237

Other Source: Total Efficiency: n/a 4π Efficiency: n/a

NOTE: The total efficiency provided is calculated per ISO 7503/1(1988) (E) 1st. MARKKINI. Total Efficiency = Instrument Efficiency x Source Efficiency, where Instrument Efficiency is calculated as net counts ÷ source 2π emission rate. The 4π efficiency is calculated as net counts ÷ source 4π activity. The provided efficiencies are applicable specific and [illegible] using source counts and background counts at the recommended operating HV. The provided efficiencies are for general information purposes only and are not to be used to replace user efficiency calculation method or results.

2013-05

Beta Wide Area Reference Source

Source no.	AC-2448
Drawing	VZ-628-001
Nuclide	Technetium-99
Activity	3.79 kBq
Beta surface emission rate	1.83E03 s^{-1} in 2 π steradian
Reference date	25 April 2013 at 12:00 UTC
Dimensions of active surface	150 mm x 100 mm
Overall dimensions	170 mm x 120 mm x 3 mm
Leakage and contamination test	The amount of the removable activity does not exceed 10 Bq. (Wipe test according to ISO 9978, no. 5.3.1)
Wipe test passed on	13 May 2013
Construction	Tc-99 is incorporated into the surface of an anodized aluminium foil of 0.3 mm thickness. The thickness of the activated layer is approximately 6 µm. The activated foil is mounted into a holder.
Measuring method	The activity was determined by comparison with a reference source of the same construction. The beta surface emission rate was measured using a windowless proportional counter.
Traceability	Additional to the direct traceability to the PTB through the DAkkS this product complies with the requirements for traceability to NIST specified in the American National Standard "Traceability of Radioactive Sources to the NIST and Associated Instrument Quality Control (ANSI N42.22-1995)". As a requirement of the ANSI N42.22-1995 Eckert & Ziegler Nuclitec GmbH participates in the NRMAP/NIST Measurements Assurance Program of the Nuclear Power Industry.
Uncertainty	The relative uncertainty of the activity is 5 %, the relative uncertainty of the beta surface emission rate is 3 %. The reported uncertainty, determined according to the DAkkS-DKD-3 report is based on the standard uncertainty multiplied by a coverage factor of k = 2, providing a level of confidence of 95 %. (Ref. NIST Technical Note 1297/"Guide to the Expression of Uncertainty in Measurement" ISO Guide, 1995)
Radioactive impurities	Related to Tc-99 (equal 100 %) the following radioactive impurities were detected: none
Quality assurance system	The quality assurance system of Eckert & Ziegler Nuclitec GmbH was certified by Lloyd's Register Quality Assurance (LRQA) according to ISO 9001, issue 2008. Isotrak products meet the requirements of 10CFR50 Appendix B in the USA.
Uniformity	The uniformity of the surface emission rate is better than 10 %.
Remark	This is an EZN Class 2 reference source. Ref: PO#3950/SO#32561, End User Ref: PO#13-0185

Measuring method	The activity was determined by comparison with a reference source of the same construction. The alpha surface emission rate was measured using a windowless proportional counter.
Traceability	Additional to the direct traceability to the PTB through the DAkkS this product complies with the requirements for traceability to NIST specified in the American National Standard "Traceability of Radioactive Sources to the NIST and Associated Instrument Quality Control (ANSI N42.22-1995)". As a requirement of the ANSI N42.22-1995 Eckert & Ziegler Nuclitec GmbH participates in the NRMAP/NIST Measurements Assurance Program of the Nuclear Power Industry.
Uncertainty	The relative uncertainty of the activity is 3 %, the relative uncertainty of the alpha surface emission rate is 3 %. The reported uncertainty, determined according to the DAkkS-DKD-3 report is based on the standard uncertainty multiplied by a coverage factor of k = 2, providing a level of confidence of 95 %. (Ref. NIST Technical Note 1297/"Guide to the Expression of Uncertainty in Measurement" ISO Guide, 1995)
Radioactive impurities	Related to Th-230 (equal 100 %) the following radioactive impurities were detected: none
Quality assurance system	The quality assurance system of Eckert & Ziegler Nuclitec GmbH was certified by Lloyd's Register Quality Assurance (LRQA) according to ISO 9001, issue 2008. Isotrak products meet the requirements of 10CFR50 Appendix B in the USA.
Uniformity	The uniformity of the surface emission rate is better than 10 %.
Remark	This is an EZN Class 2 reference source. Ref: PO#3950/SO#32561, End User Ref: PO#13-0185

Beta Wide Area Reference Source

Source no.	AC-2450
Drawing	VZ-628-001
Nuclide	Strontium-90
Activity	3.49 kBq
Beta surface emission rate	4.50E03 s^{-1} in 2 π steradian
Reference date	22 May 2013 at 12:00 UTC
Dimensions of active surface	150 mm x 100 mm
Overall dimensions	170 mm x 120 mm x 3 mm
Leakage and contamination test	The amount of the removable activity does not exceed 10 Bq. (Wipe test according to ISO 9978, no. 5.3.1)
Wipe test passed on	27 May 2013
Construction	Sr-90 is incorporated into the surface of an anodized aluminium foil of 0.3 mm thickness. The thickness of the activated layer is approximately 6 µm. The activated foil is mounted into a holder.
Measuring method	The activity was determined by comparison with a reference source of the same construction. The beta surface emission rate was measured using a windowless proportional counter.
Traceability	Additional to the direct traceability to the PTB through the DAkkS this product complies with the requirements for traceability to NIST specified in the American National Standard "Traceability of Radioactive Sources to the NIST and Associated Instrument Quality Control (ANSI N42.22-1995)". CERTIFICATE OF CALIBRATION

Electroplated Alpha Standard

S.O.# 3863
P.O.# 02-055

Description of Standard:

Model No. DNS-11 Serial No. 3972-02 Isotope Th-230

Electroplated on polished SS disc, 0.79 mm thick.

Total diameter of 4.77 cm and an active diameter of 4.45 cm.

The radioactive material is permanently fixed to the disc by heat treatment without any covering over the active surface.

Measurement Method:

The 2pi alpha emission rate was measured using an internal gas flow proportional chamber. Absolute counting of alpha particles emitted in the hemisphere above the active surface was verified by counting above, below, and at the operative voltage. The calibration is traceable to NIST by reference to an NIST calibrated alpha source S/N 2393/91.

Measurement Result:

The observed alpha particles emitted from the surface of the disc per minute (cpm) on the calibration date was:

7,970 ± 398

The total disintegration rate (dpm) assuming 1.5% backscatter of alpha particles from the surface of the disc, was:

15,700 ± 785 (0.00708 μCi)

The uncertainty of the measurement is 5 %, which is the sum of random counting error at the 99% confidence level, and the estimated upper limit of systematic error in this measurement.

CERTIFICATE OF CALIBRATION

Electroplated Beta Standard

S.O.# 3863
P.O# 02-055

Description of Standard:

Model No. DNS-12 Serial No. 3974-02 Isotope Tc-99

Electroplated on polished SS disc, 0.79 mm thick.

Total diameter of 4.77 cm and an active diameter of 4.45 cm.

The radioactive material is permanently fixed to the disc by heat treatment without any covering over the active surface.

Measurement Method:

The 2pi beta emission rate was measured using an internal gas flow proportional chamber. Absolute counting of beta particles emitted in the hemisphere above the active surface was verified by counting above, below, and at the operative voltage. The calibration is traceable to NIST by reference to an NIST calibrated beta source S/N 2148/90.

Measurement Result:

The observed beta count rate from the surface of the disc per minute (cpm) on the calibration date was:

10,400 ± 414

The total disintegration rate (dpm) assuming 25 % backscatter of beta particles from the surface of the disc, was:

16,600 ± 663 (0.00747 μCi)

The uncertainty of the measurement is 4 %, which is the sum of random counting error at the 99% confidence level, and the estimated upper limit of systematic error in this measurement.

GAMMA STANDARD SOURCE

Radionuclide:	Co-60	**Customer:**	CABRERA SERVICES, INC.
Half-life:	5.272 ± 0.001 years	**P.O. No.:**	12-0217
Catalog No.:	GF-060-D	**Reference Date:**	15-May-12 12:00 PST
Source No.:	1592-30-5	**Contained Radioactivity:**	1.040 **µCi** 38.48 **kBq**

Physical Description:

A.	Capsule type:	D (25.4 mm OD x 6.35 mm THK)
B.	Nature of active deposit:	Evaporated metallic salt
C.	Active diameter/volume:	5 mm
D.	Backing:	Epoxy
E.	Cover:	Acrylic

Radioimpurities:

None detected

Method of Calibration:

This source was assayed using gamma ray spectrometry.

Peak energy used for integration:	1173, 1333 keV
Branching ratio used:	0.9986, 0.9998 gammas per decay

Uncertainty of Measurement:

A.	Type A (random) uncertainty:	± 0.5 %
B.	Type B (systematic) uncertainty:	± 3.0 %
C.	Uncertainty in aliquot weighing:	± 0.0 %
D.	Total uncertainty at the 99% confidence level:	± 3.0 %

Notes:

- See reverse side for leak test(s) performed on this source.
- EZIP participates in a NIST measurement assurance program to establish and maintain implicit traceability for a number of nuclides, based on the blind assay (and later NIST certification) of Standard Reference Materials (as in NRC Regulatory Guide 4.15).
- Nuclear data was taken from IAEA-TECDOC-619, 1991.
- This source has a working life of 5 years.

APPENDIX B

Scan Minimum Detectable Concentration Calculations

Surface gamma scanning will be performed as part of the final status survey. Scan surveys will be performed to identify areas of elevated gamma radiation that could result from potential contamination. The results of the surface gamma scan surveys will be used to determine when a final status survey can be initiated. The scan survey results will also be used to identify areas of elevated gamma radiation where bias measurements will be performed to demonstrate compliance with the derived concentration guideline level. This appendix describes the methods used to develop a priori scan minimum detectable concentrations (MDCs) used to support selection of instrumentation and measurement methods based on the project measurement quality objectives.

1.0 SCAN MINIMUM DETECTABLE CONCENTRATION

Hand-held 3-inch by 3-inch thallium-activated sodium iodide (NaI(Tl)) detectors will be used to scan for elevated concentrations of Cs-137, Ra-226, and other gamma-emitting radionuclides in soil. The assumptions, methodology, and calculation of the detector response using the 3-inch by 3-inch NaI(Tl) detectors over soil areas for anticipated conditions and situations are described in this section. For this calculation, the detector is assumed to be suspended 15 cm above the center of the source of gamma radiation. The source is assumed to be uniformly contaminated soil 15 cm thick with a diameter of 56 cm. The calculations and methodologies used to determine the MDC follow the guidance contained in NUREG-1507, Section 6.8.2 (USNRC, 1997).

1.1 SCAN MDC CALCULATION AND METHODOLOGY

The methodology used to determine the NaI(Tl) detector scan MDC is based on NUREG-1507, Section 6.8.2. Factors included in this analysis are the surveyor scan efficiency, index of sensitivity, the natural background of the surveyed area, scan rate, detector to source geometry, areal extent of the hot spot, and energy and yield of gamma emissions.

Microshield® was used to model the presence of a normalized 1 picocurie per gram (pCi/g) total Cs-137, Ra-226, or Am-241 activity in soil with the further assumption that the activity is uniformly distributed to a depth of 15 cm and spread over a disk-shaped area with a diameter of 56 cm, simulating the area of a 55-gallon drum. The uncontaminated soil cover has zero thickness (contamination extends to the surface) and there is a 0.51 cm aluminum shield surrounding the NaI(Tl) detector. The assumed density of soil is 1.6 grams per cubic centimeter (g/cm^3). Federal Guidance Report 12 composition was used for the soil constituents. This model is consistent with the NUREG-1507 methodology and provides for calculating a count rate to exposure rate ratio (counts per minute/microroentgen per hour [cpm/μR/hr]).

The following sections provide tabulated data based upon the NUREG-1507 methodology as applied toward the NaI(Tl) detector planned for this survey, volumetric soil contamination extending to the surface, and a 56-cm diameter disc of soil uniformly contaminated to a depth of 15 cm. The dose point is centered 15 cm over the contaminated disk of soil, where the NaI(Tl) detector will be suspended. Additional details and discussion describing the NUREG analysis methodology are described in that publication. Tables 1, 2, and 3 include scan MDC calculations for a 2-inch by 2-inch NaI detector (Model 44-10), 3-inch by 3-inch NaI detector (Model 44-20), a Field Instrument for the Detection of Low Energy Radiation (FIDLER, Model G-5), and a large area 4-inch by 4-inch by 16 inch NaI detector (Model RSI 700). Microshield® outputs are attached at the end of this appendix.

1.1.1 Fluence Rate to Exposure Rate (FRER, no units)

The fluence rate to exposure rate (FRER) may be approximated using NUREG-1507 Equation 6-15:

FRER ~ (1 μR/hr)/(E_γ)(μ_{en}/ρ)$_{air}$

Where,

E_γ = energy of the gamma photon of concern, kiloelectron volts (keV)

(μ_{en}/ρ)$_{air}$ = the mass energy absorption coefficient for air, square centimeters per gram (cm^2/g)

The FRER is shown in tabular form in Table 1 for Cs-137, Table 2 for Ra-226, and Table 3 for Am-241.

1.1.2 Probability of Interaction (P) Through Detector End for a Given Energy

The probability, P, of a gamma ray interaction in the NaI scintillation crystal entering through the end of the crystal is given by NUREG-1507 Equation 6-16:

$$Probability\ (P) = 1 - e^{-(\mu/\rho)_{NaI}(X)(\rho_{NaI})}$$

Where;

(μ/ρ)$_{NaI}$ = the mass attenuation coefficient for NaI

X = the thickness of the 3-inch by 3-inch NaI(Tl) crystal, 7.6 cm

ρ_{NaI} = the density of the NaI(Tl) crystal, 3.67 g/cm^3

Values for P are listed in Tables 1, 2, and 3.

1.1.3 Relative Detector Response

The Relative Detector Response (RDR) by energy is determined by multiplying the relative fluence rate to exposure rate (FRER) by the probability (P) of an interaction and is given by:

RDR = FRER (table 1) x P (from Table 2)

Values for RDR are listed in Tables 1, 2, and 3.

1.1.4 Determination of cpm per μR/hr as a Function of Energy

The FRER, P, and finally RDR have been calculated at a range of energies for a NaI(Tl) detector. Calculation of these values specifically at the cesium-137 (^{137}Cs) energy of 662 keV has also been performed.

If:

- the energy$_\gamma$ (based upon ^{137}Cs) is 662 keV, and
- the FRER conversion at 662 keV is 0.0514, and
- the mass energy absorption coefficient is 0.0294 cm^2/g, and
- the mass attenuation coefficient of a NaI crystal is 0.078 cm^2/g, and
- the probability of interaction, P, at 662 keV is 0.77 for the 44-10 detector.

Then:

- the ^{137}Cs RDR at 662 keV is 0.039 for the 44-10 detector.

The detector manufacturer, Ludlum Instruments, provides a value of 900 cpm per µR/h for the Ludlum Model 44-10 2-inch by 2-inch NaI(Tl) detector for ^{137}Cs at 662 keV.

Finally, the cpm per µR/h at each energy for the NaI(Tl) detector is obtained by taking the ratio of the RDR for a specific energy to the RDR for ^{137}Cs at 662 keV, and multiplying by the manufacturer-provided detector response at 662 keV of 900 cpm per µR/h using the following equation:

$$Detector\ Response_{E_i} = (Detector\ Response_{Cs-137}) \times \frac{RDR_{E_i}}{RDR_{Cs-137}}$$

Where:

E_i = Gamma energy, keV

RDR = relative detector response from Table 3

$\text{Detector Response}_{\text{Cs-137}}$ = Manufacturer provided value, 900 cpm per µR/h

The detector response for each energy is provided in cpm per µR/h in Tables 1, 2, and 3.

1.1.5 Determination of Detector Weighted Response

Finally, the detector weighted response expressed as a ratio of count rate to exposure rate for the sum of the gamma emissions and their contribution to the total exposure rate for each radionuclide may be computed using the output of the Microshield® calculation and the detector response values from Tables 1, 2, and 3.

The detector weighted response is calculated using NUREG-1507 Equation 6-17:

$$Detector\ Weighted\ Response_{E_i} = \frac{Exposure\ Rate_{E_i}}{Exposure\ Rate_{Total}} \times Detector\ Response_{E_i}$$

Where:

E_i = Gamma energy, keV

$\text{Exposure Rate}_{\text{Ei}}$ = Energy specific MicroShield exposure rate, µR/h

$\text{Exposure Rate}_{\text{Total}}$ = Sum of energy specific MicroShield exposure rates, µR/h

Tables 1, 2, and 3 provide the detector weighted response in cpm per µR/h, along with the total exposure rate based on the MicroShield calculation.

1.1.6 Determination of Scan MDC

The minimum detectable count rate, MDCR, is calculated by combining NUREG-1507 Equations 6-4 and 6-5:

$\text{MDCR} = (d') \times (b_i)^{0.5} \times (60\ \text{sec}/1\ \text{min})$

Where d' is equal to 1.38 from table 6.1 of NUREG-1507, and represents the rate of detections at a 95% true positive proportion with a false positive proportion of 60%. The number of background counts during the count interval is b_i. The reference area background count rate is estimated at

approximately 9,000 cpm (150 cps) for the Model 44-10 detector. The MDCR value for a scan speed of 0.5 m/s with an observation interval of 2 seconds is 958 counts.

The Minimum Detectable Count Rate for the surveyor is calculated as:

$MDCR_{surveyor} = MDCR/(p)^{0.5}$

Where

p = Surveyor Efficiency, equal to 0.5 (NUREG-1507 suggests values between 0.5 and 0.75)

The $MDCR_{surveyor}$ for Cs-137 is 1,355 counts for the Model 44-10.

The Minimum Detectable Exposure Rate ($MDER_{surveyor}$) for the surveyor is obtained by dividing the $MDCR_{surveyor}$, 1,355 counts for Cs-137, by the total Detector Weighted Response, 1,026 cpm per μR/hr for Cs-137 its progeny for the Model 44-10 from Table 1. The $MDER_{surveyor}$ for Cs-137 with a scan speed of 0.5 m/s is 1.32 μR/hr for the Model 44-10.

The scan MDC is equal to the ratio of the $MDER_{surveyor}$, 1.32 μR/hr, to the total weighted MicroShield® Exposure Rate for the normalized 1 pCi/g concentration of Cs-137, 0.15 μR/hr. The Scan MDC value for ^{137}Cs for a Model 44-10 NaI detector with a scan speed of 0.5 m/s is 8.8 pCi/g.

1.2 CONCLUSION

The 2-inch by 2-inch Model 44-10 NaI scintillation detector scan MDC suspended 15 cm over the surface being measured for Cs-137 uniformly distributed in surface soil with dimensions of 56 cm diameter and 15 cm thick, is estimated to be 8.8 pCi/g for a scan speed of 0.5 m/s. The scan MDC for Ra-226 is calculated to be 2.7 pCi/g, and the scan MDC for Am-241 is calculated to be 8.9 pCi/g. These values as computed indicate the 2-inch by 2-inch NaI detector is a sensitive instrument that agrees with scan MDC data presented in NUREG-1507 Section 6.8.2 and MARSSIM Table 6.7 for the contaminants of concern.

Alpha and beta measurements will be performed during the final status survey (FSS) using gas proportional and scintillation detectors. Alpha and beta measurements performed during the FSS will include scanning, static measurements performed to estimate total surface activity, and smear samples counted to estimated removable surface activity. This appendix describes the development of detection limits for alpha and beta radiation using different detectors to perform different types of measurements by providing the calculations and assumptions used.

2.0 ALPHA AND BETA MDC CALCULATIONS

A beta scan survey will be performed to demonstrate the concrete surface of the pedestal has been remediated and is ready for final status survey as part of the remediation support survey. The results of the scan measurements will be used to direct additional removal of concrete to remove contamination. The final beta scan demonstrating there is no remaining contamination will be included as part of the FSS.

2.1 EFFICIENCY

Instrument efficiencies are determined based on International Organization for Standardization (ISO) Guidance 7503, Measurement of Radioactivity – Measurement and Evaluation of Surface Contamination, 2016. Large area sources (150 cm^2) were used to measure the detector response averaged over the entire face of the detector for the Ludlum Model 43-37 large area gas proportional detector. Instrument efficiencies are determined on contact with the surface and raised off the surface to simulate the detector geometry during scanning.

The surface efficiency is a factor of the surface material and the energy of the emitted radiations. ISO-7503 recommends using a surface efficiency of 0.5 for beta particles with maximum beta energy greater than 150 kiloelectron volts (keV). Both Cs-137 and Sr-90 have maximum beta energies greater than 150 keV, so a value of 0.5 was used for beta particles measured as part of this FSS. A value of 0.25 was used for alpha particles measured as part of this FSS.

The total efficiency is the product of the instrument efficiency and the surface efficiency.

The total efficiency for the Ludlum Model 43-37 detector at a height of 1 cm above the surface was 0.200 for beta radiation. The total efficiency for the 43-37 detector at a height of 2 cm above the surface was 0.185 for beta radiation. The total efficiency for the 43-37 detector on contact with the surface was 0.215 for beta radiation and 0.0524 for alpha radiation.

The total efficiency for the Ludlum Model 43-93 scintillator was 0.1199 for beta radiation and 0.0977 for alpha radiation.

The total efficiency for the Ludlum Model 2929 sample counter used for counting smears was 0.170 for alpha radiation and 0.1575 for beta radiation.

2.2 BACKGROUND

MDC calculations are performed using estimates of material-specific backgrounds expected to be encountered in the field. Alpha and beta background count rates on concrete surfaces were measured in the concrete reference background area for the Model 43-37 and Model 43-93 detectors.

The background count rates for the Model 43-37 detector were 1008.5 cpm beta and 8.9 cpm alpha. The background count rates for the Model 43-93 detector were 279 cpm beta and 2.3 cpm alpha.

The Model 2929 smear counter will be used to count smears in a low background area, and the instrument background can be used to develop MDC values. The instrument background for the Model 2929 is 0.1 cpm alpha and 36 cpm beta.

2.3 BETA SCAN MDC

MARSSIM Section 6.7.2.1 provides guidance for determining the scan MDC for beta and gamma radiation.

The first step is calculating the minimum detectable count rate (MDCR) using a combination of MARSSIM Equation 6-8 and 6-9:

$$MDCR = d' \times \sqrt{b_i} \times \frac{60}{i}$$

Where d' is equal to 1.38 from table 6.5 of MARSSIM and represents the rate of detections at a 95% true positive proportion with a false positive proportion of 60%. The number of background counts during the count interval is b_i. The reference area background count rate is 1008.5 cpm beta for the Model 43-37 and 279 cpm for the Model 43-93. The MDCR for the Model 43-37 gas proportional detector with a count interval of 1 second is:

$$MDCR = 1.38 \times \sqrt{\frac{1008.5\ cpm}{60\ s/m}} \times \frac{60\ s/m}{1\ s} = 339.5\ cpm$$

The beta scan MDC is calculated using MARSSIM Equation 6-10:

$$Scan\ MDC = \frac{MDCR}{\sqrt{p} \times \varepsilon_i \times \varepsilon_s \times \frac{A}{100}}$$

Where;

ε_i	=	instrument efficiency (detector specific)
ε_s	=	surface efficiency (0.5, ISO-7503 recommended value))
p	=	surveyor efficiency (0.5, MARSSIM recommended value)
A	=	probe active area (detector specific)

The beta scan MDC for the Model 43-37 gas proportional detector with a count interval of 1 second at a height of 2 cm above the surface is:

$$Scan\ MDC = \frac{339.5\ cpm}{\sqrt{0.5} \times 0.185\ {}^{cpm}/_{dpm} \times \frac{584\ cm^2}{100\ cm^2}} = 444\ {}^{dpm}/_{100\ cm^2}$$

The Model 43-37 gas proportional detector was used to scan for beta activity with a scan rate of one detector width per second and detect radioactivity below the cleanup goals listed in the FSSR Table 3-1.

2.4 ALPHA AND BETA STATIC AND SMEAR MEASUREMENT MDC

Alpha and beta static and smear measurement MDCs were calculated using the generic Stapleton equation provided in MARSAME Table 7.6. This equation is the most appropriate calculation for background counts less than 100 and situations where the background count time is different from the sample count time. This equation is also acceptable for higher background counts.

$$MDC = \frac{\frac{\left(z_{1-\alpha} + z_{1-\beta}\right)}{4}\left(1 + \frac{t_S}{t_B}\right) + \left(z_{1-\alpha} + z_{1-\beta}\right)\sqrt{N_B \frac{t_S}{t_B}\left(1 + \frac{t_S}{t_B}\right)}}{\varepsilon_i \varepsilon_s t_S \frac{W_A}{100}}$$

Where:

$z_{1-\alpha}$	=	quantile of the standard normal distribution for α (1.645 for α=0.05)
$z_{1-\beta}$	=	quantile of the standard normal distribution for β (1.645 for β=0.05)
t_S	=	sample counting time
t_B	=	background counting time
N_B	=	number of background counts during background counting time
ε_i	=	instrument efficiency (counts per particle)
ε_s	=	surface efficiency (particles per disintegration, 0.25 for α, 0.5 for β)
W_A	=	active area of the detector window (cm^2)

Sample and background count times were adjusted to provide a combination of count times that achieve the project objectives to detect radiation at levels below the MDC requirements listed in Table 3-1 of the FSSR.

The Model 43-37 gas proportional detector can achieve the desired MDC with static count times of 1 minute and a background count time of 20 minutes for static counts on contact with the concrete surface.

The Model 43-93 scintillation detector can achieve the desired MDC with static count times of 2 minutes and a background count time of 16 minutes for static counts on contact with the concrete surface.

The Model 2929 smear counter can achieve the desired MDC with smear count times of 1 minute and background count times of 200 minutes for counting smears collected over a surface area of 100 cm^2.

MEMORANDUM

To: Eric Barbour, USACE

From: Scott Hay, Cabrera Services Inc.

Date: August 5, 2021

Subject: Pedestal Drain Status for Final Status Survey

Remediation of the Stack pedestal is complete. The purpose of this memorandum is to document the remediation of the Stack drains, radiological status of the drains prior to final status survey (FSS), and describe the anticipated activities leading to release of the pedestal.

Conceptual Site Model

The three drain lines imbedded in the Stack concrete are stainless steel. Drain A is located on the west side of the pedestal and collected water from a trench drain located at the interface where the Silencer connected with the Stack. Drain B is in the middle of the pedestal with a drain pipe running from southeast to northwest, including a sump in the center of the pedestal. Drain C was located on the east side of the pedestal and was designed to drain any liquids collecting between the planned double wall of the Stack. Since the exterior portion of the double wall was not completed, Drain C was outside the Stack.

Water potentially containing radioactive material, either dissolved or as suspended particulates, would enter the drains and flow to the collection tank. Little or no contamination was expected to be associated with the interior stainless-steel surfaces. Any radioactive contamination inside the pipes, including debris from demolition of the Stack and Silencer, was expected to be removable activity. The planned FSS activities in the FSP include measurements of removable radioactivity at the exposed ends of the pipes.

Summary of Remedial Activities

The Stack water collection system (holding tank, drain pipes) was removed in February 2021, leaving three drain lines exiting the northwest side of the pedestal. Smears collected from inside the three pipes reported less than 5 dpm/100 cm^2 alpha and less than 125 dpm/100 cm^2 beta, less than the removable activity release limits of 20 dpm/100 cm^2 alpha and 200 dpm/100 cm^2 beta listed in the FSP. The drain lines were capped to prevent the potential spread of contamination.

Issues associated with removal of surface concrete contamination resulted in a decision to cut and remove approximately 12-inches of concrete. Cutting the concrete also cut the three drain lines providing access to the pipes. In particular, Drain B was cut on an angle providing access to approximately one foot of the interior surface of the pipe.

A survey of removable activity on the inside surface of Drain B on 7/13/2021 confirmed there was no removable alpha activity, but the removable beta activity was reported at 556 dpm/100 cm^2. Drain A and Drain C were blocked with debris and no measurements were performed.

Once the concrete cutting was completed the surface of the pedestal was cleaned and the debris removed from Drain A and Drain C. Alpha activity for all three drains was below the release criteria with

a maximum of 37 dpm/100 cm^2 total surface activity for Drain B and a maximum of 6.5 dpm/100 cm^2removable surface activity for Drain B. However, total beta surface activity for Drain A exceeded 10,000 dpm/100 cm^2, and exceeded 200,000 dpm/100 cm^2 for Drain B.

The drains were flushed to remove loose surface contamination and the total surface activity was reduced to less than 5,000 dpm/100 cm^2 for Drain A and less than 50,000 dpm/100 cm^2 for Drain B. More aggressive remediation using muriatic acid and scrubbing to remove visible black stains from the inside surface of Drain B further reduced the total surface activity in Drain B to less than 2,500 dpm/100 cm^2. All cleaning solutions and debris generated during remediation were collected, solidified, and are currently staged for transport to WCS for disposal.

A remedial action support survey was performed on 8/5/2021 to determine the pedestal is ready for FSS. The results of the survey show a maximum removable alpha activity of 13 dpm/100 cm^2 for Drain B, and no detectable removable beta activity for all three drains.

Planned Future Activities

The FSS will be performed as described in the FSP. The remedial action support survey reports levels of removable alpha and beta activity in all three drains are below the project release limits. Therefore, the pipes are expected to pass the FSS.

The presence of fixed beta contamination inside Drain A and Drain B was unexpected based on the conceptual site model. There is a potential for fixed residual radioactivity to remain on the inside surfaces of pipes for Drain A and Drain B. All three drains will be grouted to reduce the potential for residual radioactivity to result in future exposures.
