Charge order in the cuprates

Superconductivity and charge order

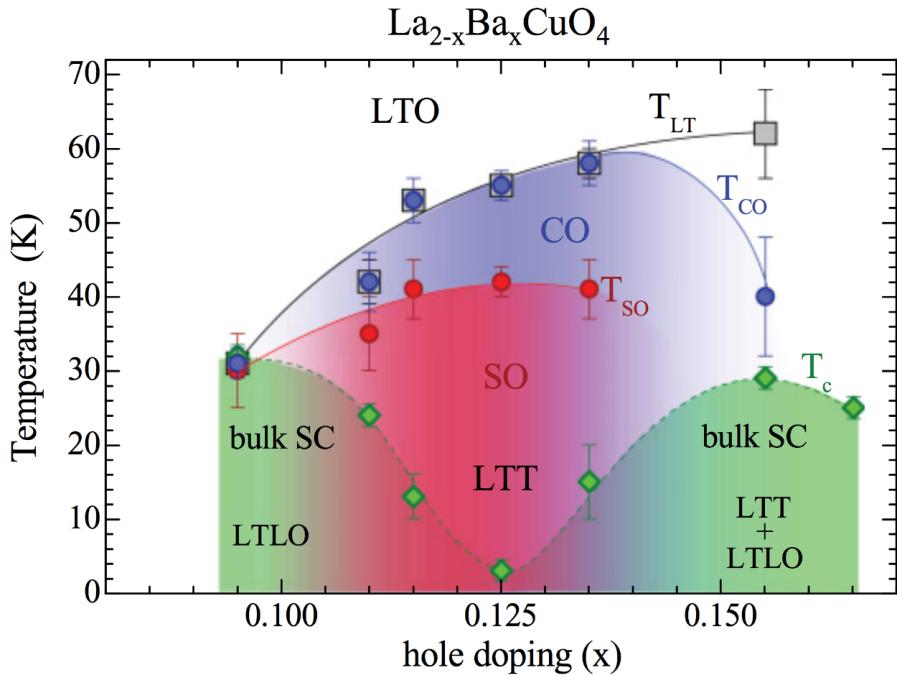

e.g. Chiang et al. Nature Phys. 8, 871–876 (2012),
Gerber et al. Science 350, 949-952 (2015), etc.

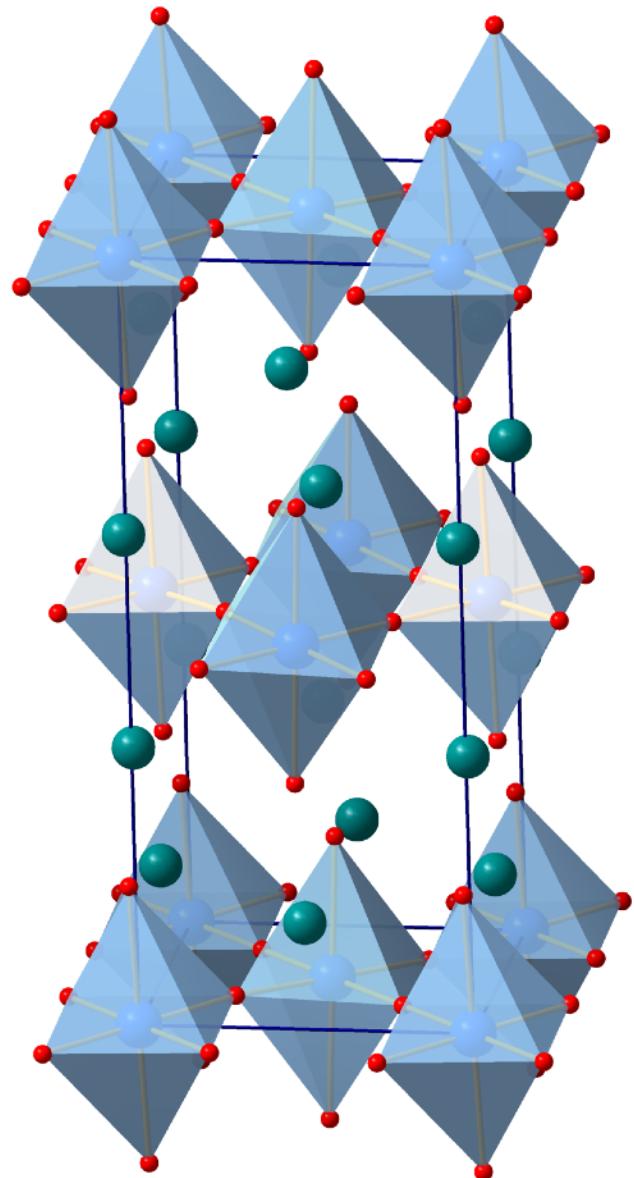

e.g. Kivelson et al. Nature 393, 550 (1998)
C. Castellani PRL 75, 4650 (1995)

- Static CO competes with SC for states at E_F
- CO fluctuations may cooperate or intertwine with SC

Charge order in $\text{La}_{2-x}\text{Ba}_x\text{CuO}_4$

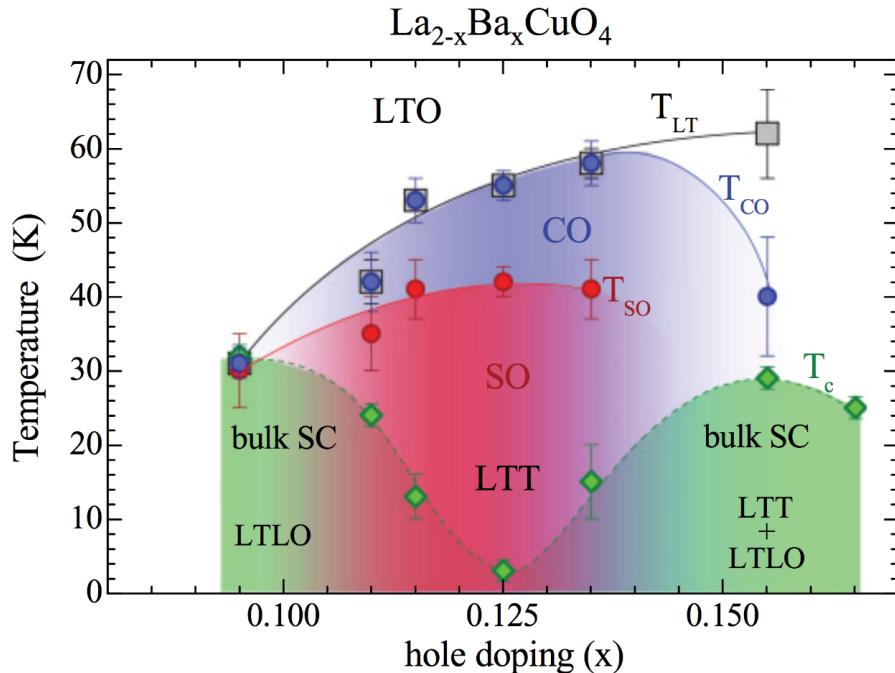

Hücker et al. PRB 83, 104506 (2011)

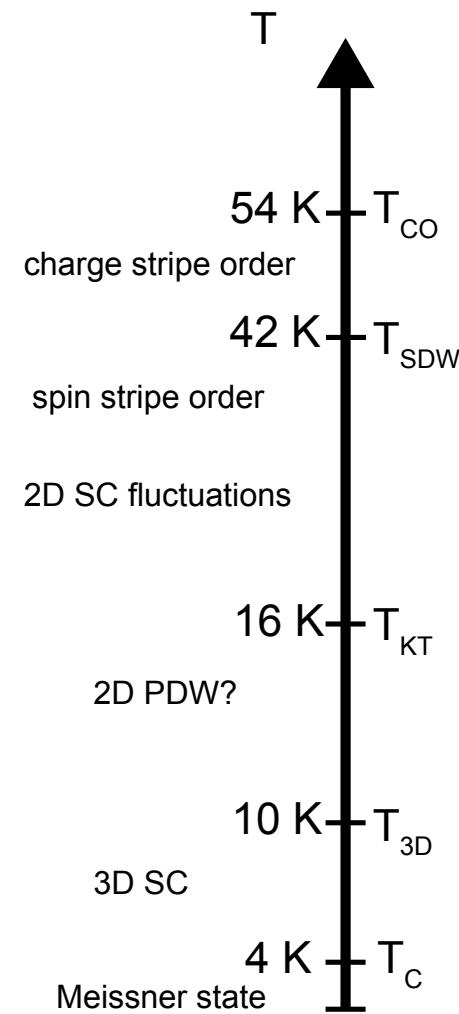

- Striped single layer cuprate
- Strong 1/8 anomaly

Charge order in $\text{La}_{2-x}\text{Ba}_x\text{CuO}_4$

Hücker et al. PRB 83, 104506 (2011)

- Striped single layer cuprate
- Strong 1/8 anomaly
- 2D high-T SC fluctuations

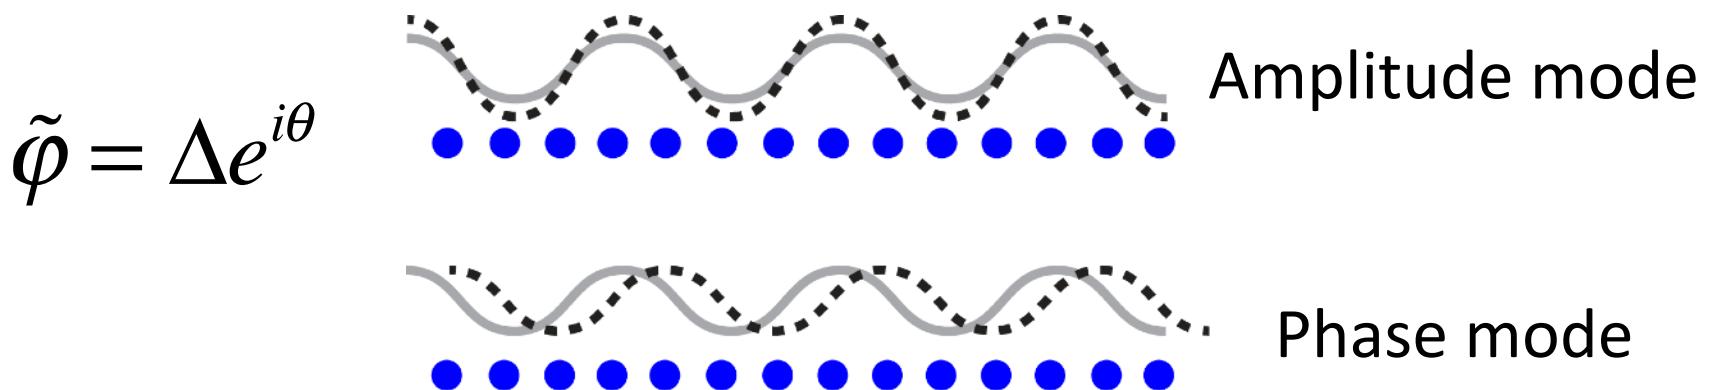

Fradkin et al. RMP 457, 104506 (2015)

Need to measure charge order fluctuations

What kind of fluctuations?

Electronic liquid crystals fluctuate

But hydrodynamics also requires:

Diffusive modes (vorticity, thermal diffusion,...)

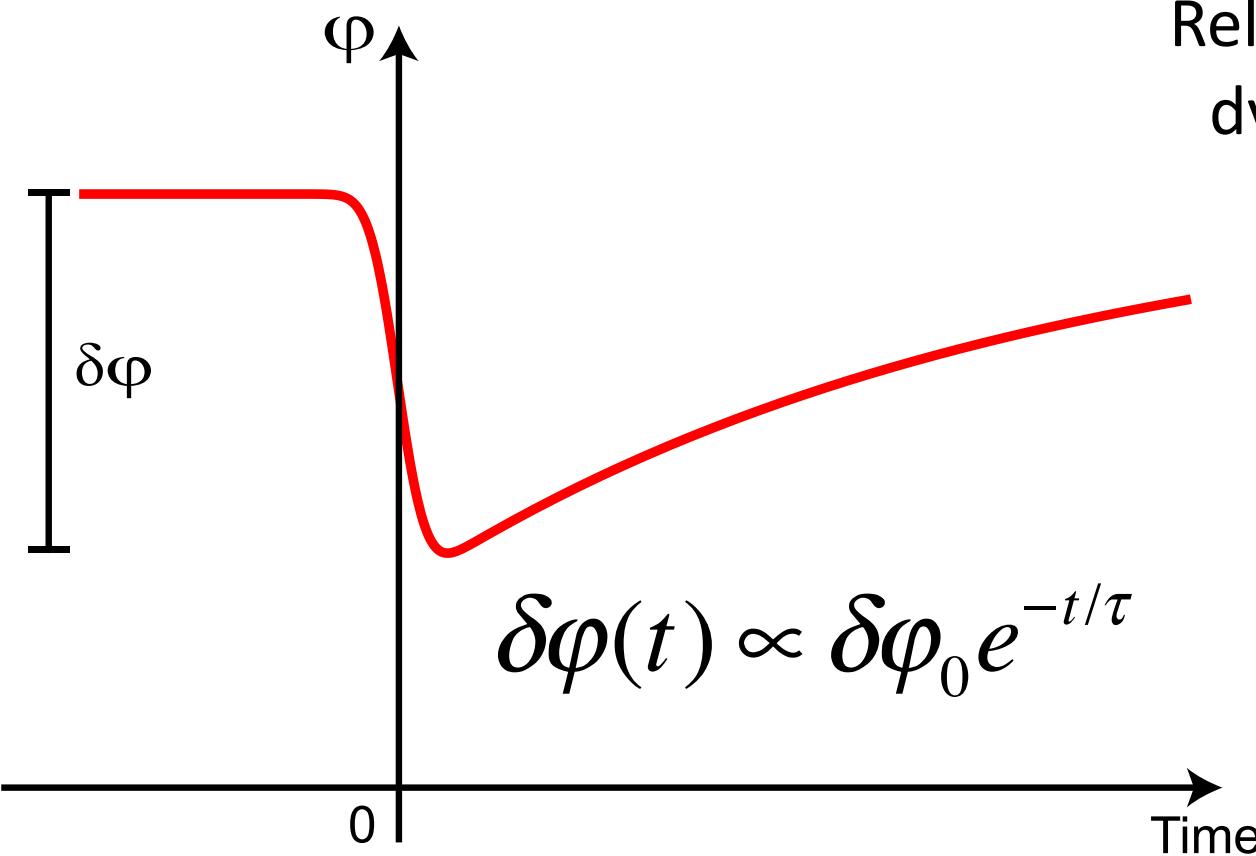

Relevant energy scale is $O(k_B T_c) \sim 1\text{-}10 \text{ meV}$

Measuring fluctuations in time-domain

Evolution of a perturbed
order parameter

$$\frac{\delta F}{\delta \varphi} = \frac{1}{\Gamma} \frac{\partial \varphi}{\partial t}$$

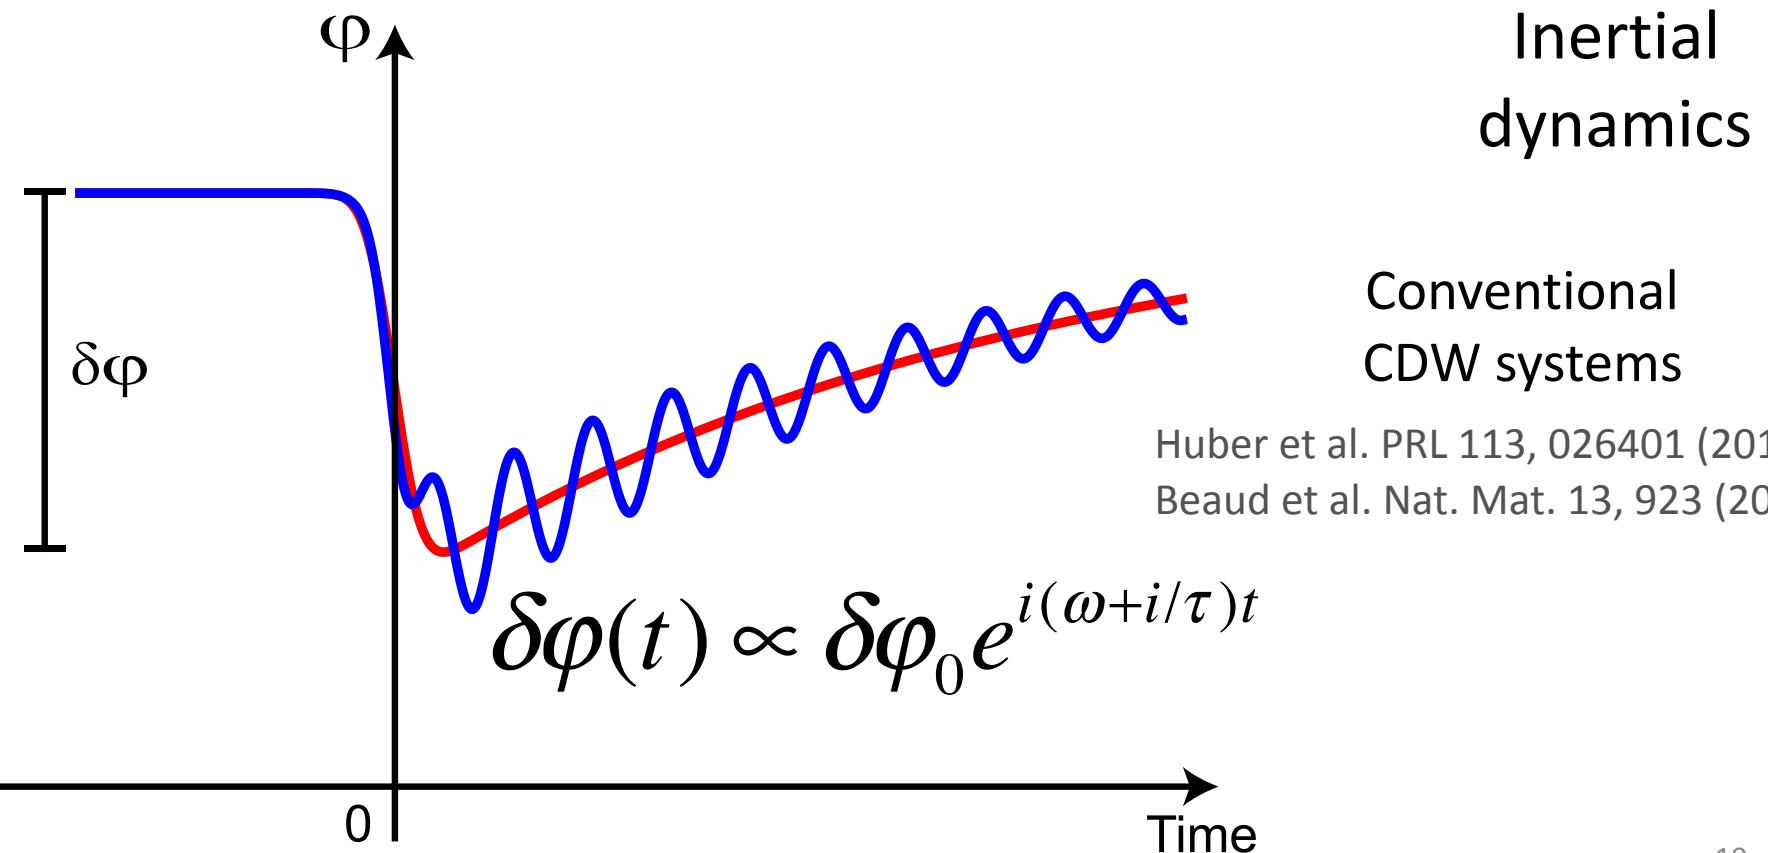

Relaxational
dynamics

Measuring fluctuations in time-domain

Evolution of a perturbed
order parameter

$$\frac{\delta F}{\delta \varphi} = -\frac{1}{\Gamma} \frac{\partial \varphi}{\partial t} \boxed{\mu \frac{\partial^2 \varphi}{\partial t^2}}$$

Need for a scattering probe

Evidence of sub-20 meV dynamics

Torchinsky et al. Nature Materials 12, 387 (2013)

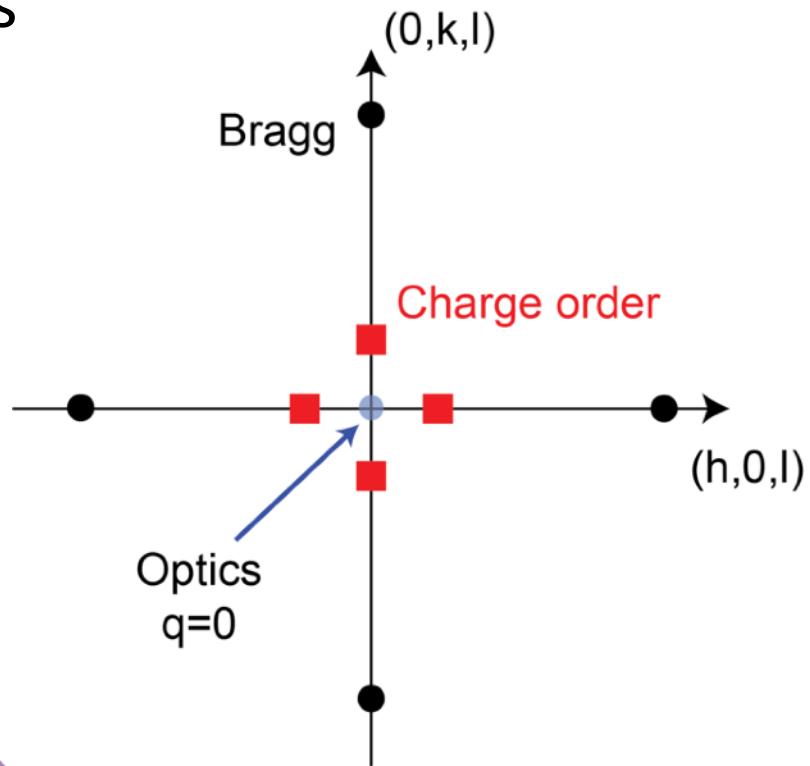

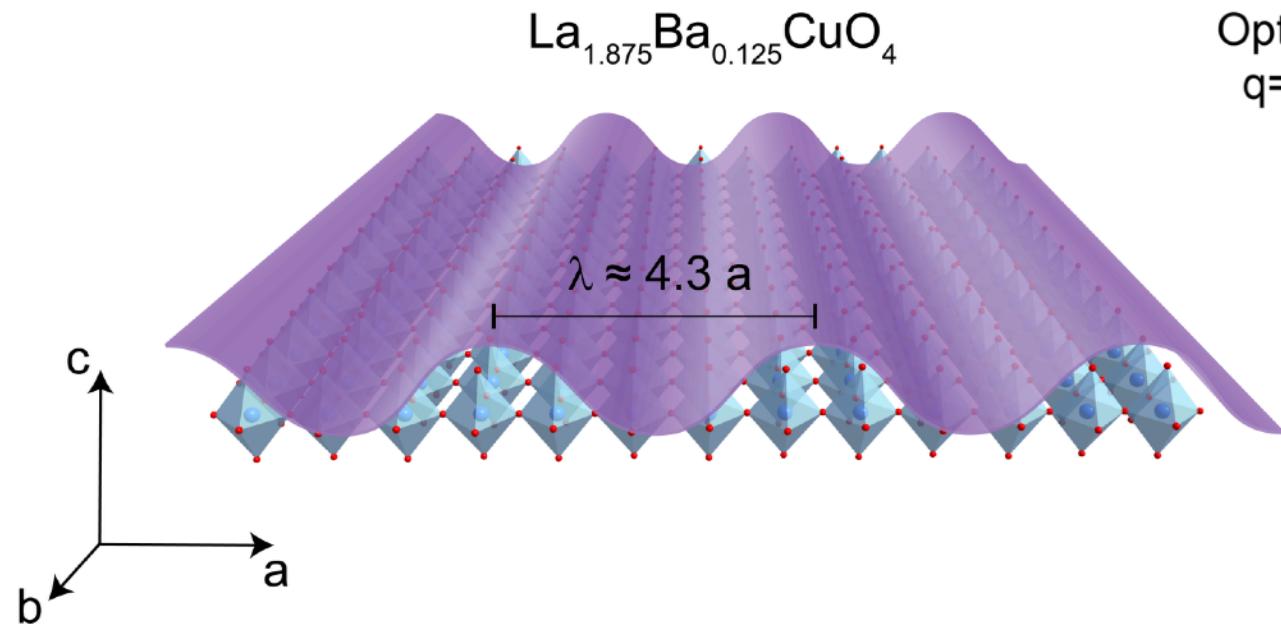

Hinton et al. PRB 88, 060508 (2013)

Dakovski et al. PRB 91, 220506 (2015)

Ergecen et al. forthcoming (2019)

Arpaia et al. arXiv: 1809.04949 (2018)

But order parameter at finite q

Need for a scattering probe

Evidence of sub-20 meV dynamics

Torchinsky et al. Nature Materials 12, 387 (2013)

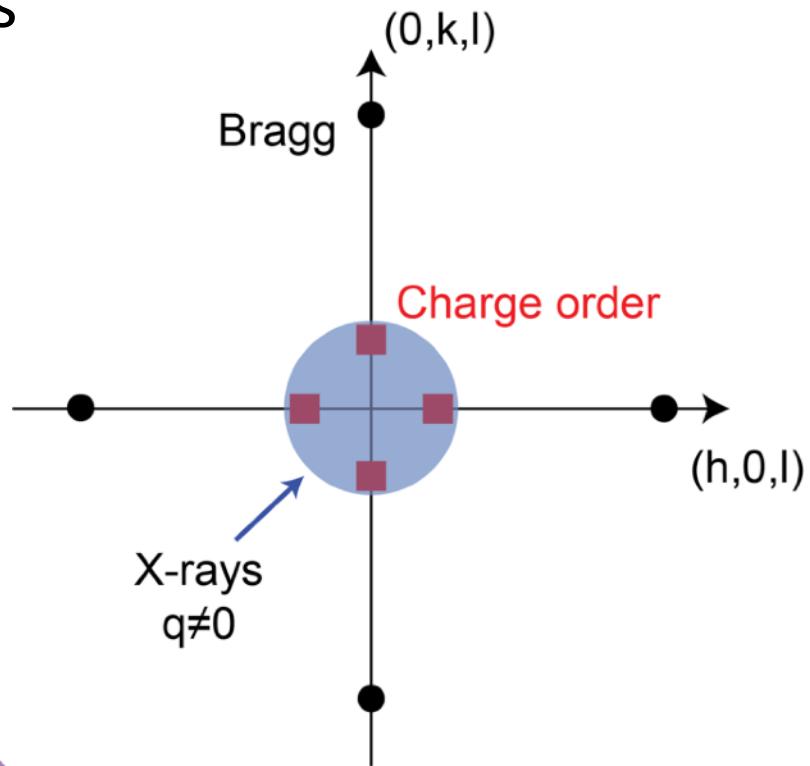

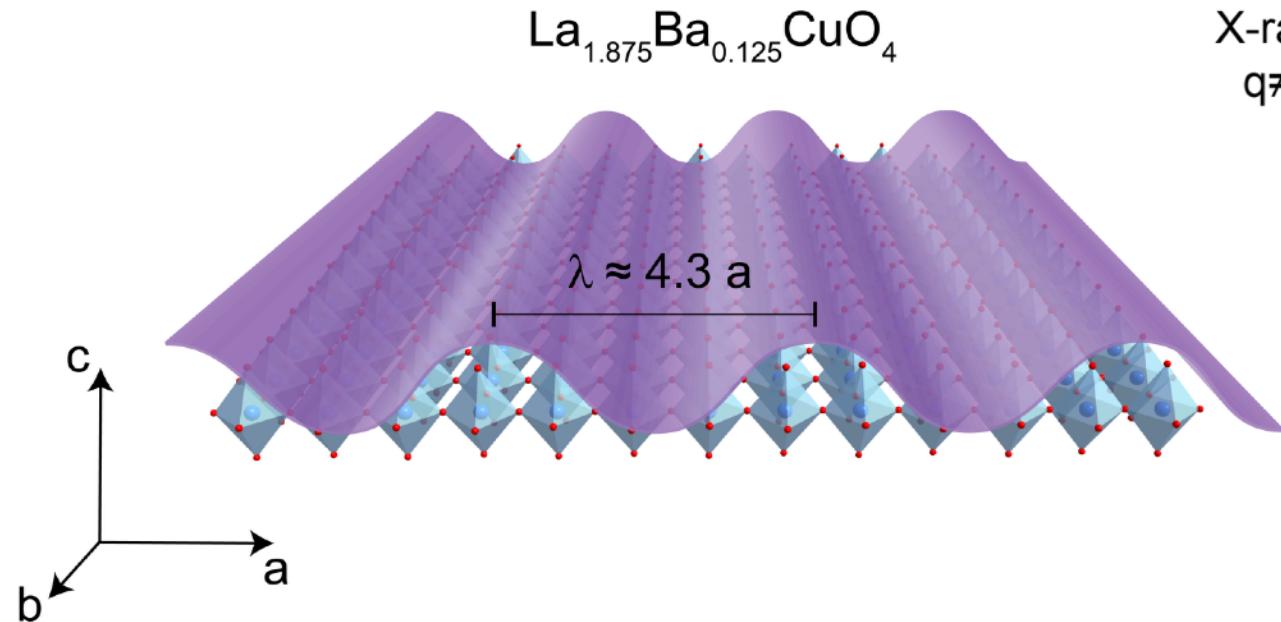

Hinton et al. PRB 88, 060508 (2013)

Dakovski et al. PRB 91, 220506 (2015)

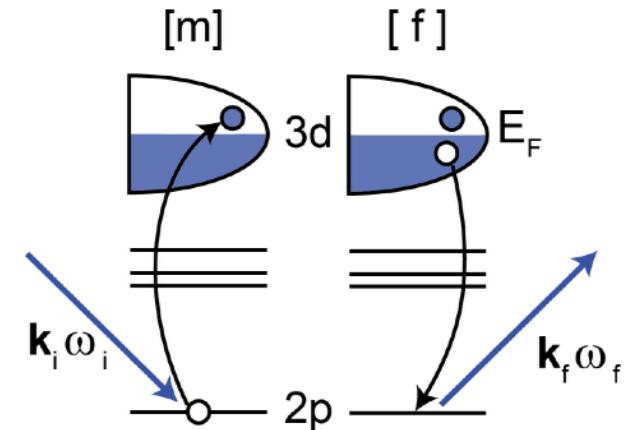

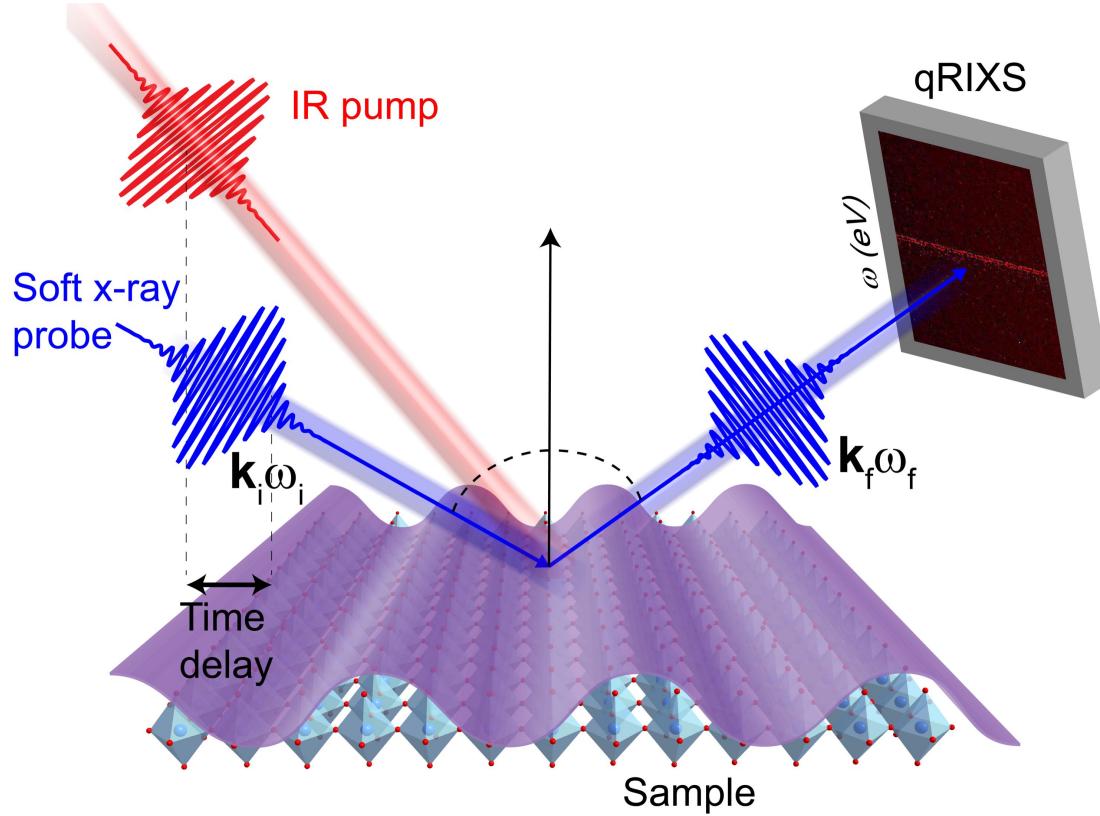

Ergecen et al. forthcoming (2019)

Arpaia et al. arXiv: 1809.04949 (2018)

But order parameter at finite q

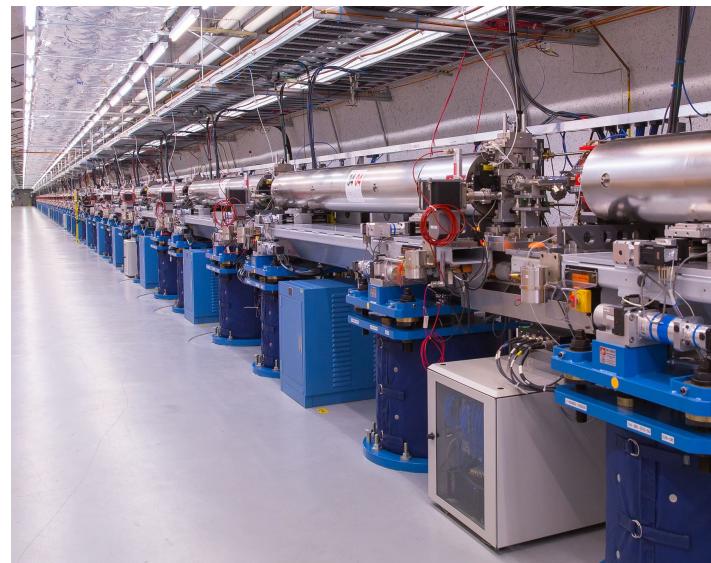

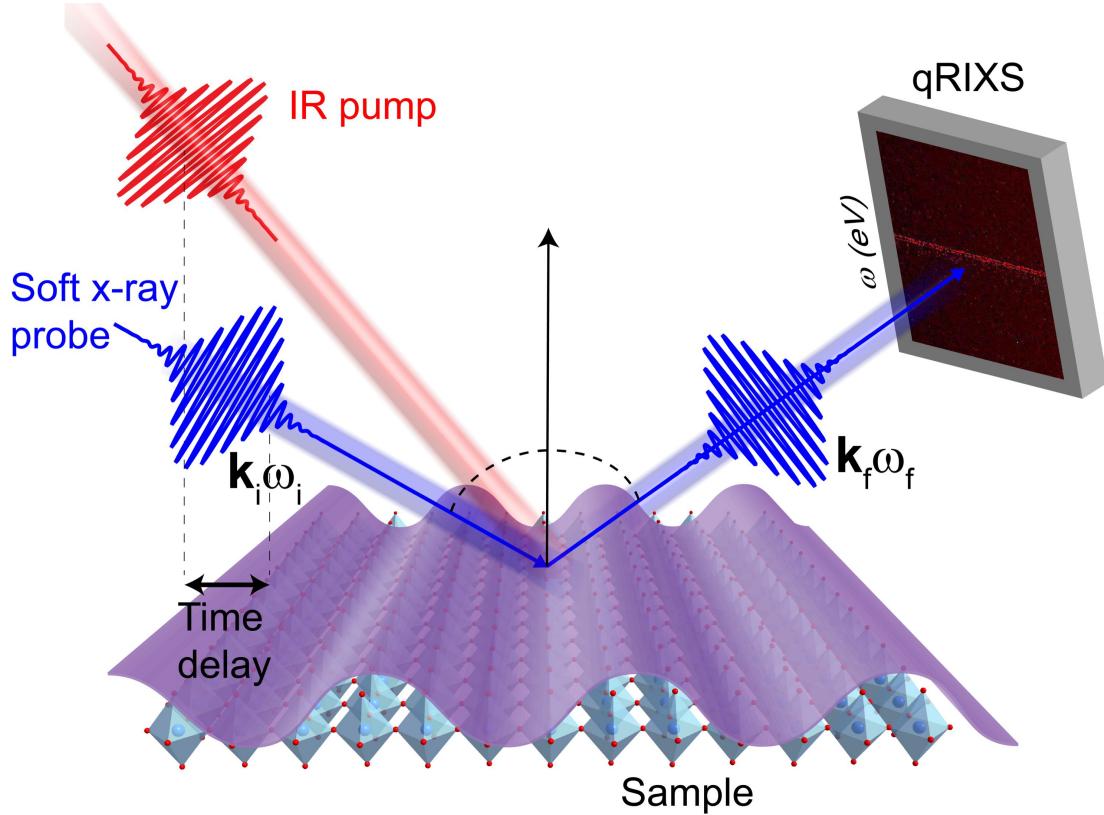

Probing charge order dynamics with trRSXS

Direct RSXS at
Cu L edge
(931.5 eV)

- Resonant process sensitive to valence holes
- trRSXS probes finite-q order parameter dynamics

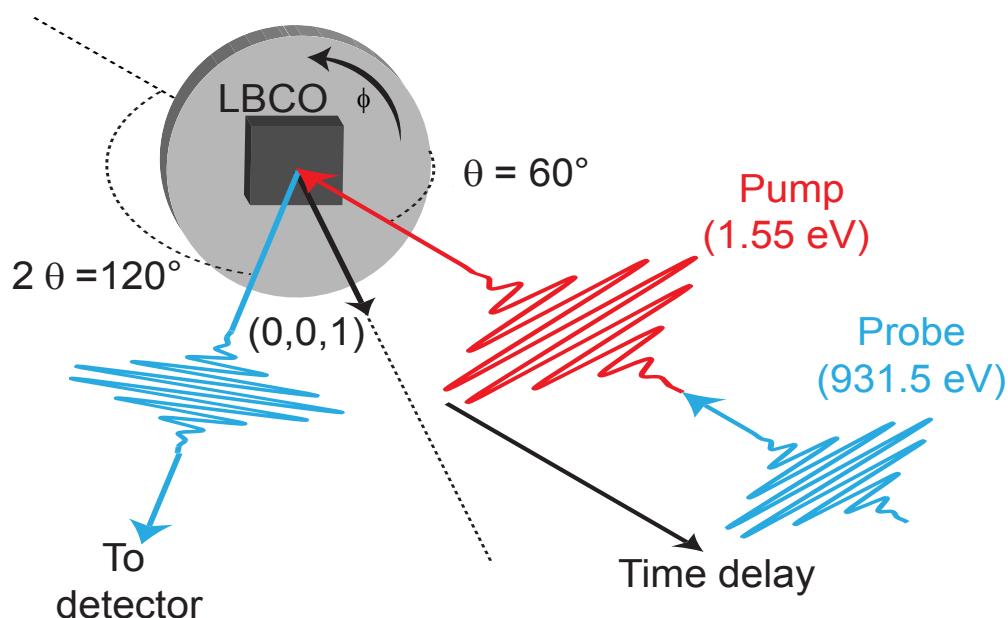

Probing charge order dynamics with trRSXS

**LCLS Free
Electron Laser**

- Resonant process sensitive to valence holes
- trRSXS probes finite-q order parameter dynamics

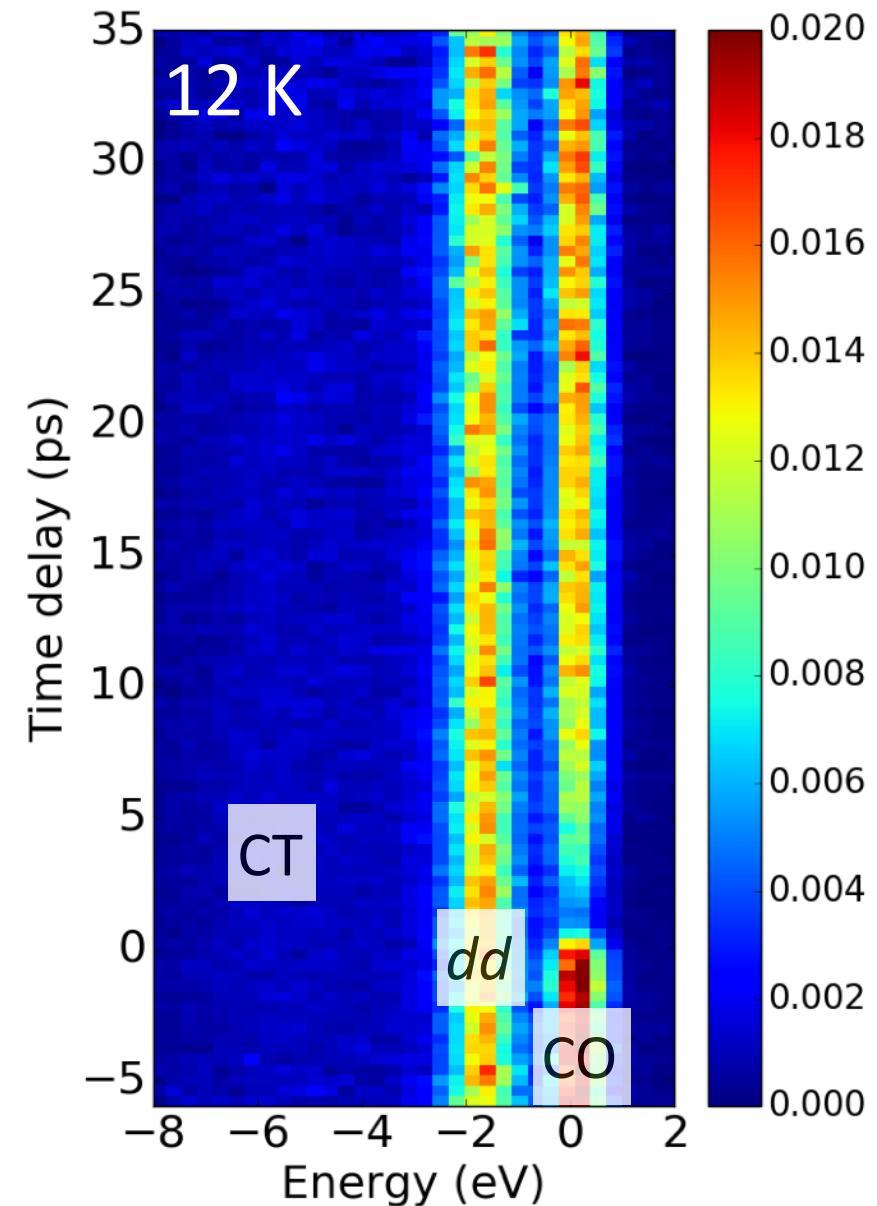

The tr-RSXS experiment

- Both energy-resolved and energy-integrated
- High-temporal resolution (130 fs)

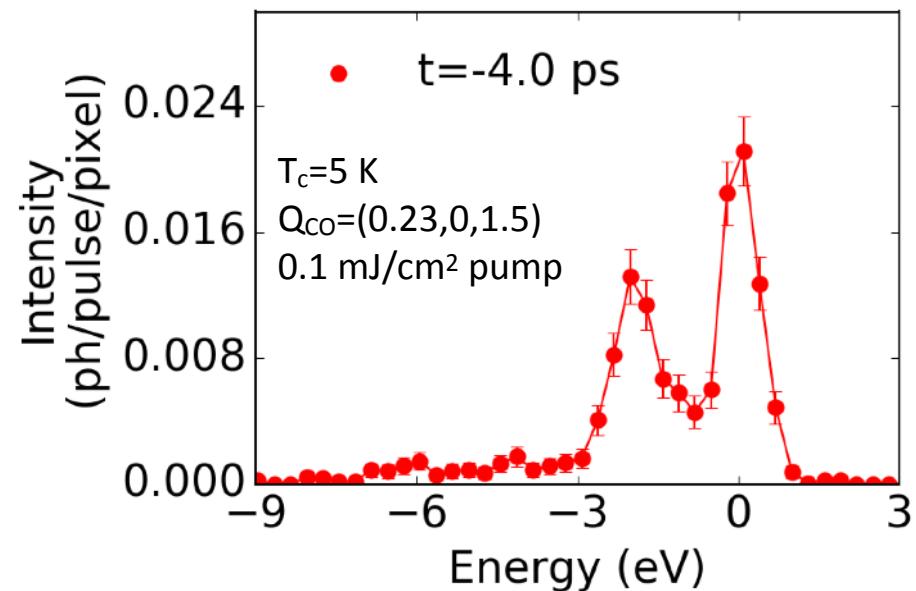

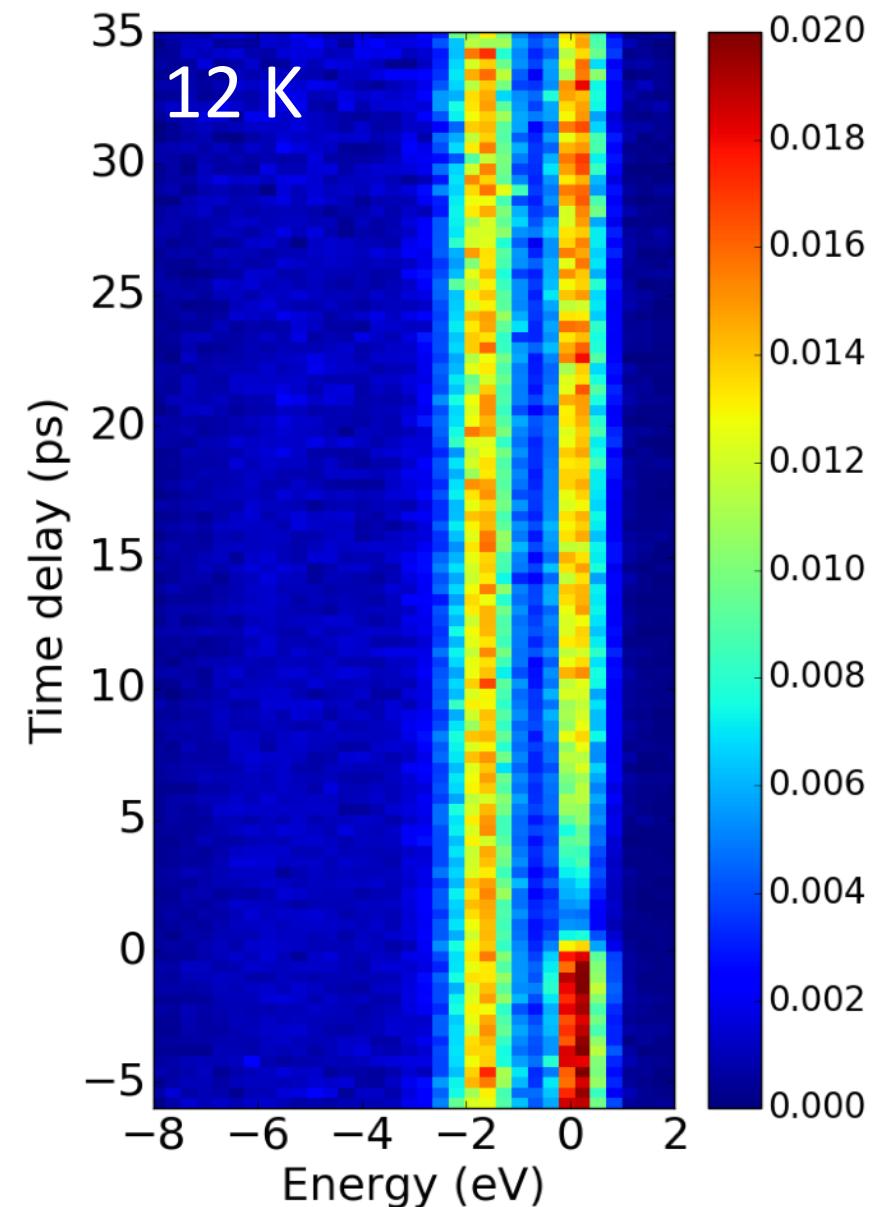

Revealing the CO dynamics of LBCO-1/8

Pump selectively targets charge order

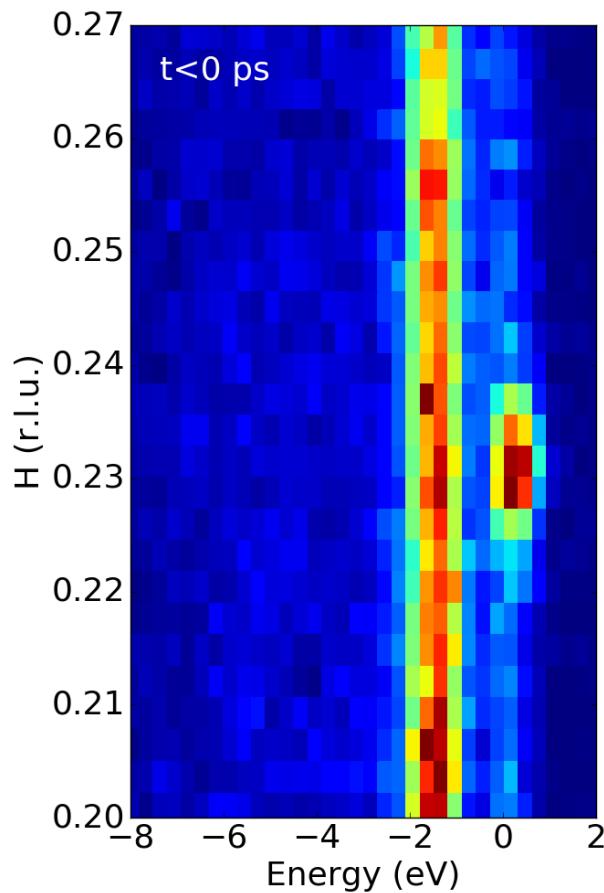

- Only CO responds
- Intensity not conserved
- $\Delta E = 0.65 \text{ eV}$ @ Cu L₃ edge

Pump selectively targets charge order

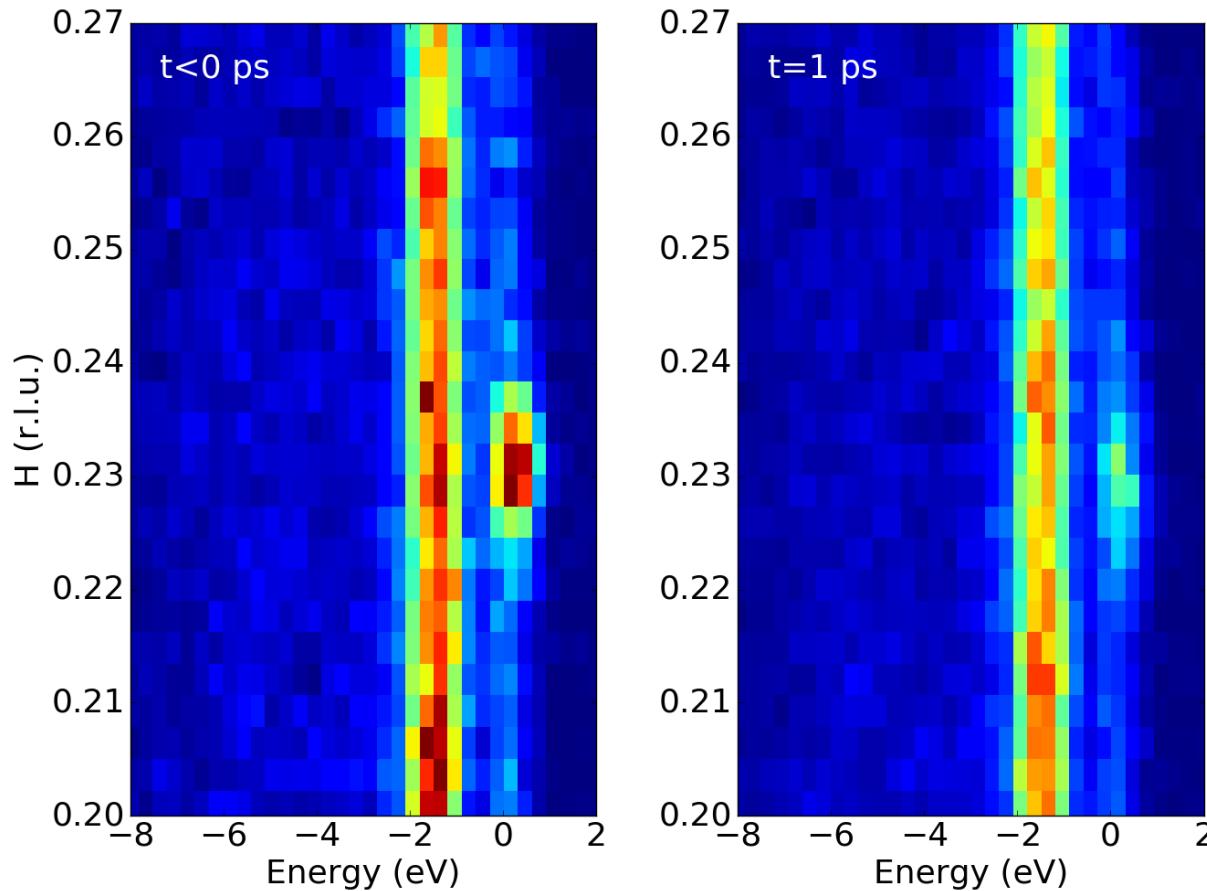

- Only CO responds
- Intensity not conserved
- $\Delta E = 0.65 \text{ eV}$ @ Cu L₃ edge

Momentum-resolved order parameter quench

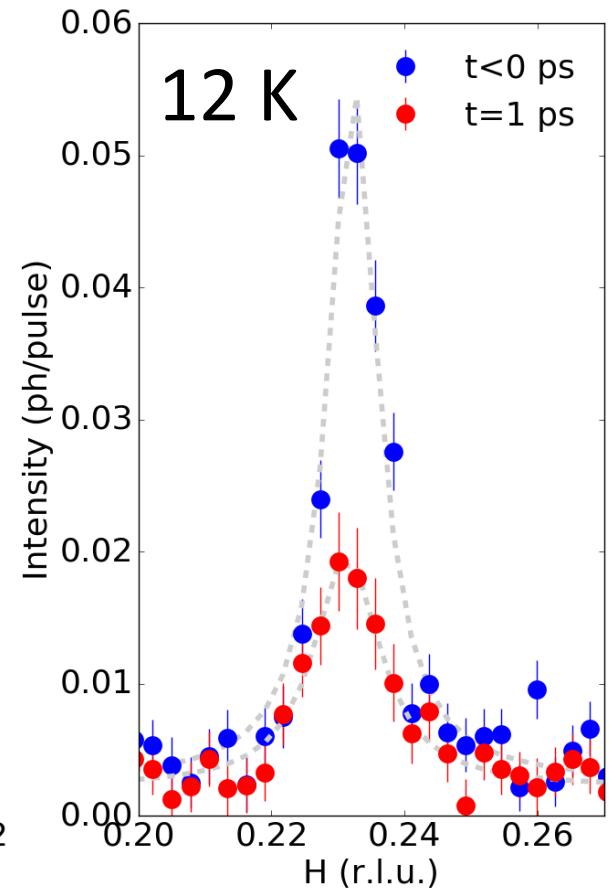

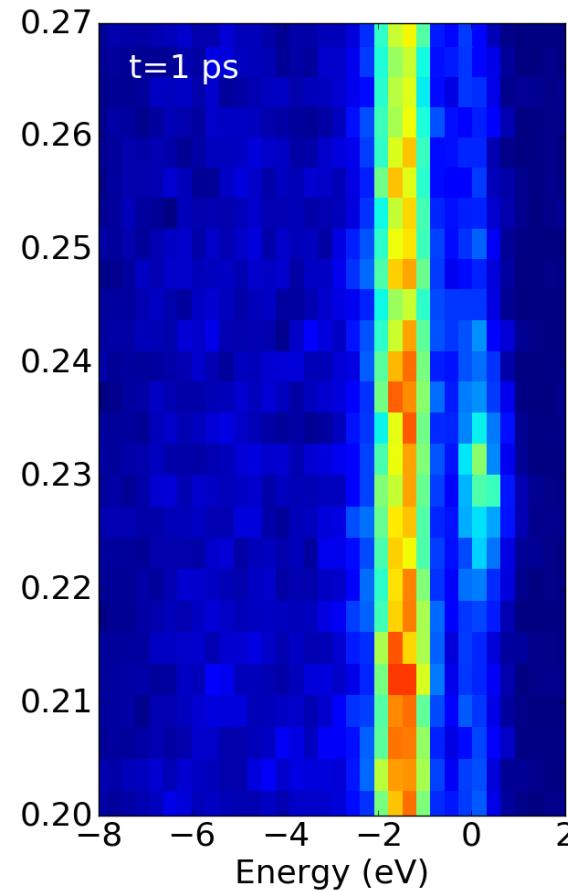

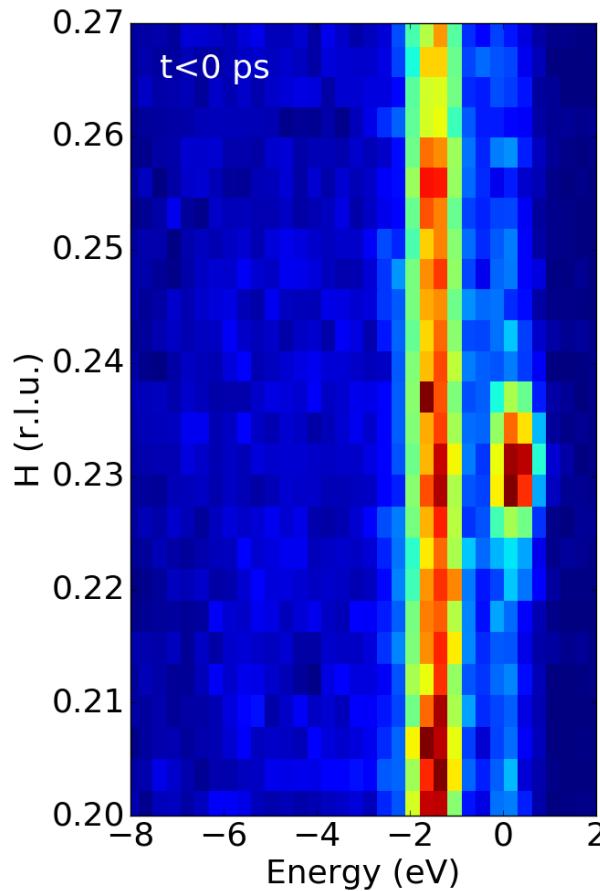

Momentum-resolved order parameter quench

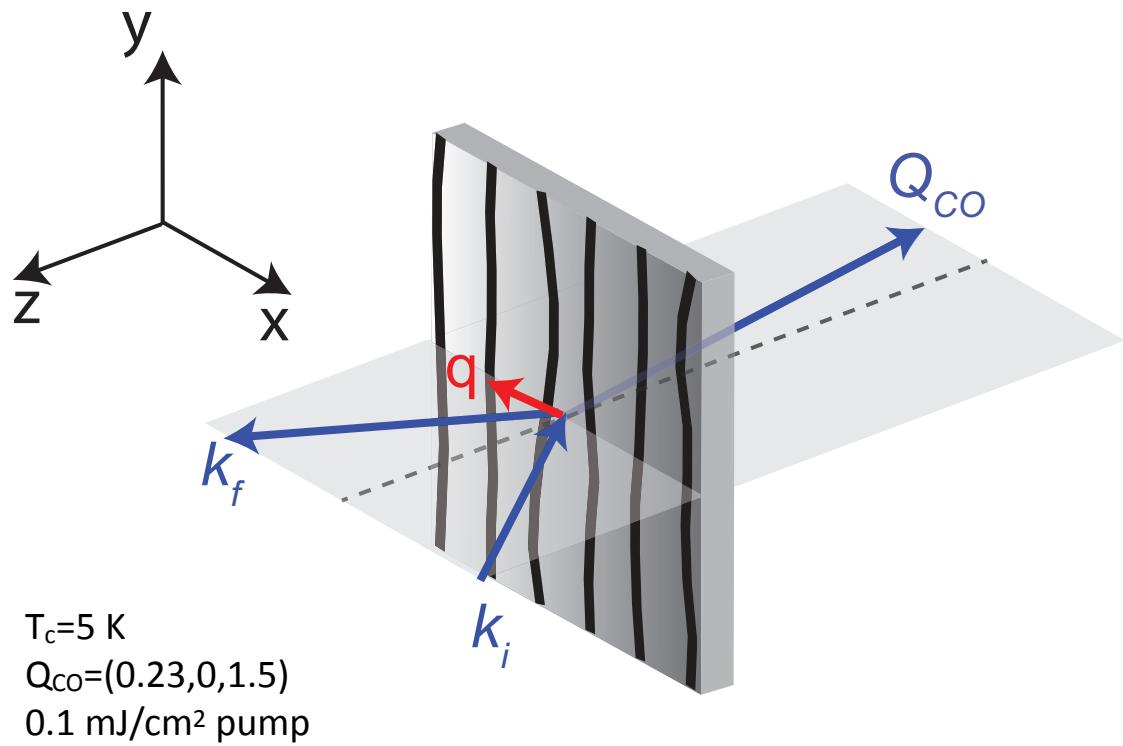

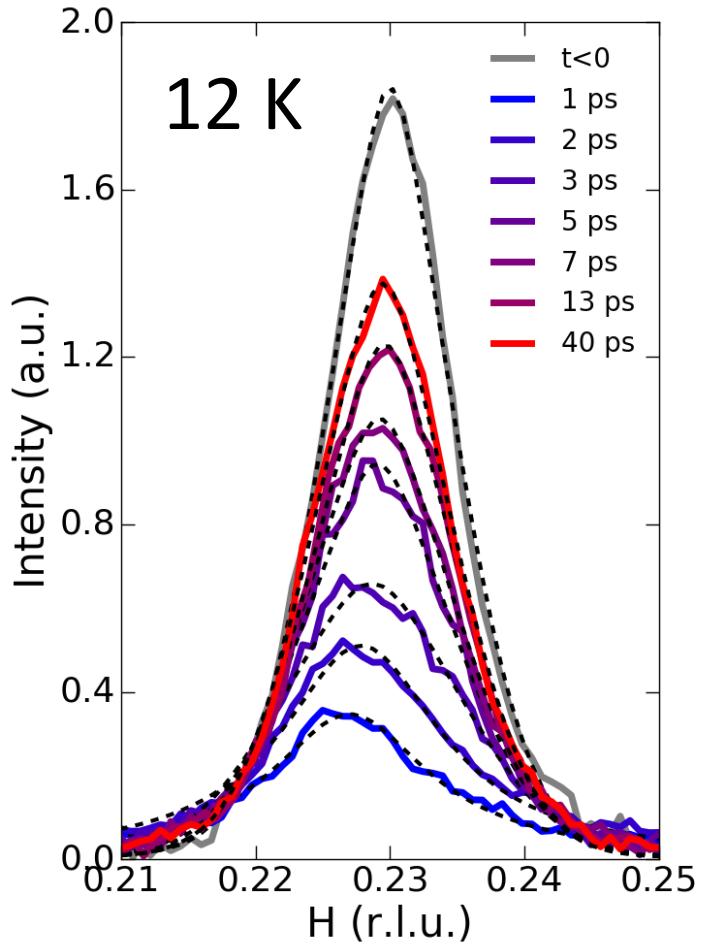

- CO peak drops 75% in intensity
- Momentum broadening by 45% (defects)

Momentum-resolved order parameter quench

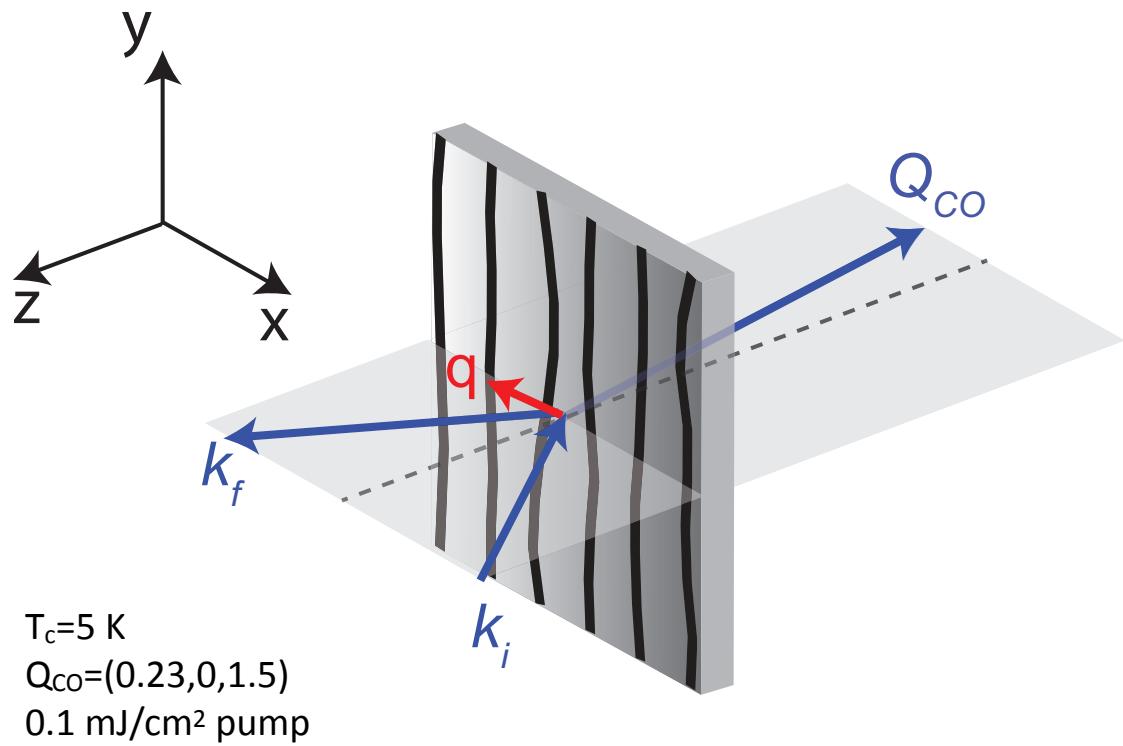

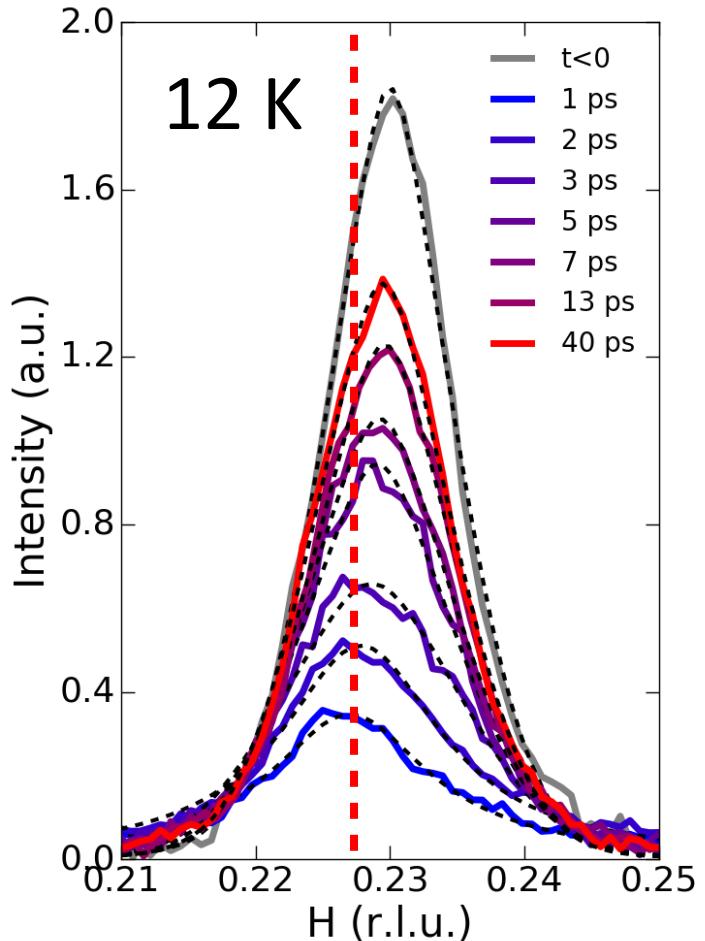

- CO peak drops 75% in intensity
- Momentum broadening by 45% (defects)

Dynamics of the charge order recovery

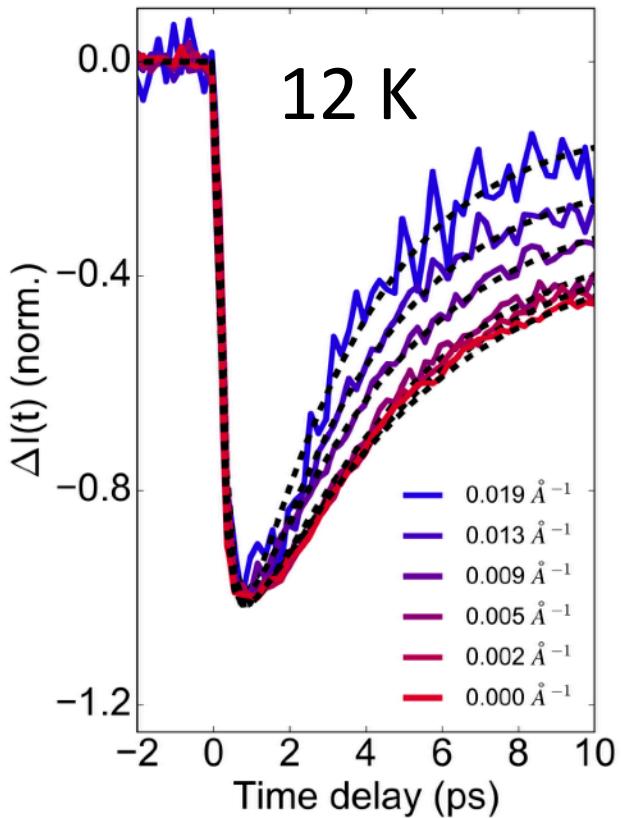

Sampling transverse charge order fluctuations in time

Dynamics of the charge order recovery

Sampling transverse charge order fluctuations in time

Evidence of diffusive charge order mode

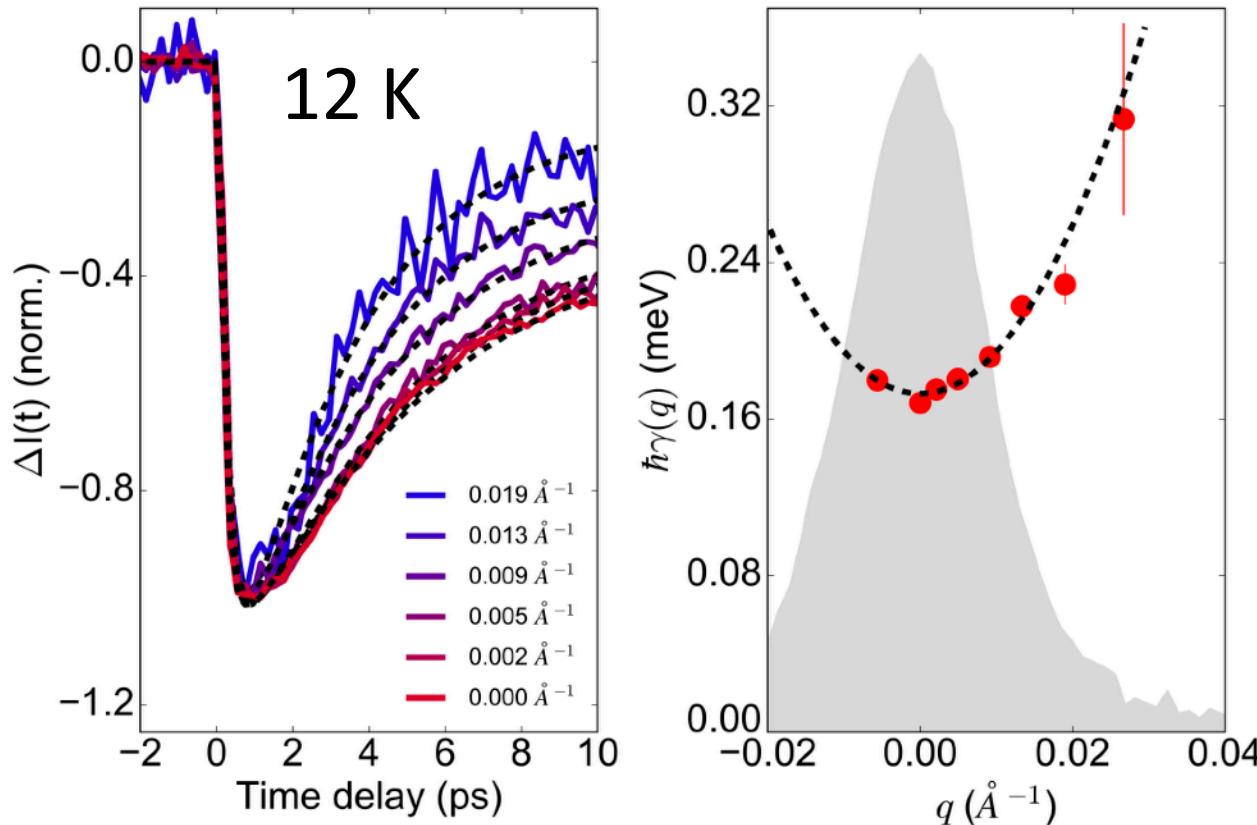

Relaxational
dynamics

$$\frac{\delta F}{\delta \varphi} = -\frac{1}{\Gamma} \frac{\partial \varphi}{\partial t}$$

$$\delta \varphi(t) \propto \delta \varphi_0 e^{-t/\tau}$$

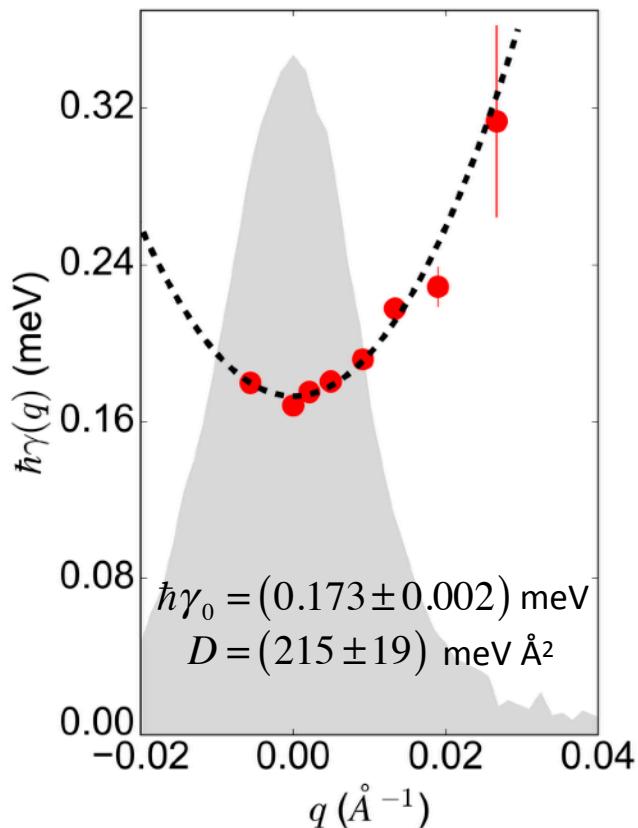

- No coherent oscillations (gapless)

Evidence of diffusive charge order mode

- No coherent oscillations (gapless)
- Recovery scales with q^2

Evidence of diffusive charge order mode

$$\frac{\delta F}{\delta\varphi} = -\frac{1}{\Gamma}\frac{\partial\varphi}{\partial t}$$

$$F[\varphi] = a\varphi^2 + b\varphi^4 + c(\nabla\varphi)^2$$

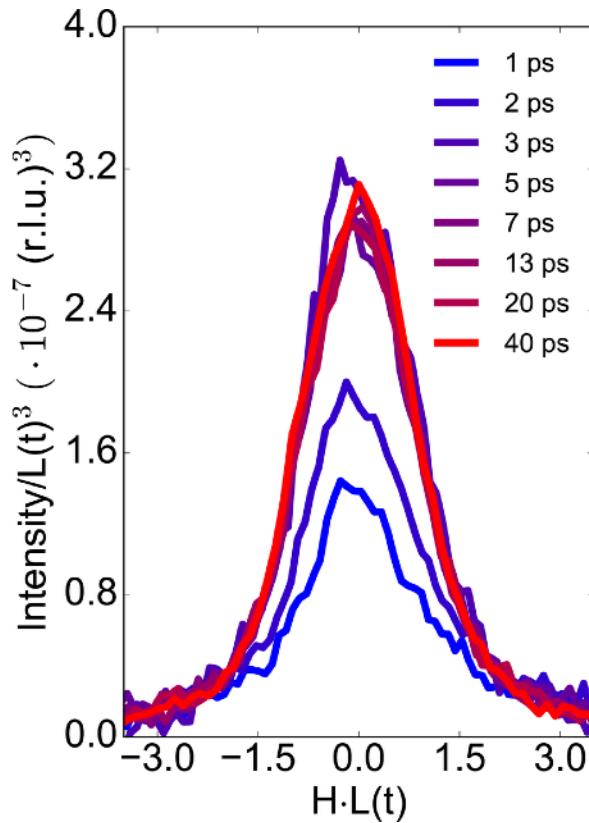

$$\frac{\partial\varphi}{\partial t} - \frac{1}{\tau_0} \varphi - D\nabla^2\varphi = 0$$

Relaxation Diffusion

Transverse CO diffusion at energy $O(k_B T_c)$

$$i\hbar\gamma(q) = \hbar(\gamma_0 + Dq^2) \sim 2 \text{ K}$$

Dynamic critical scaling and defects

Previously observed in

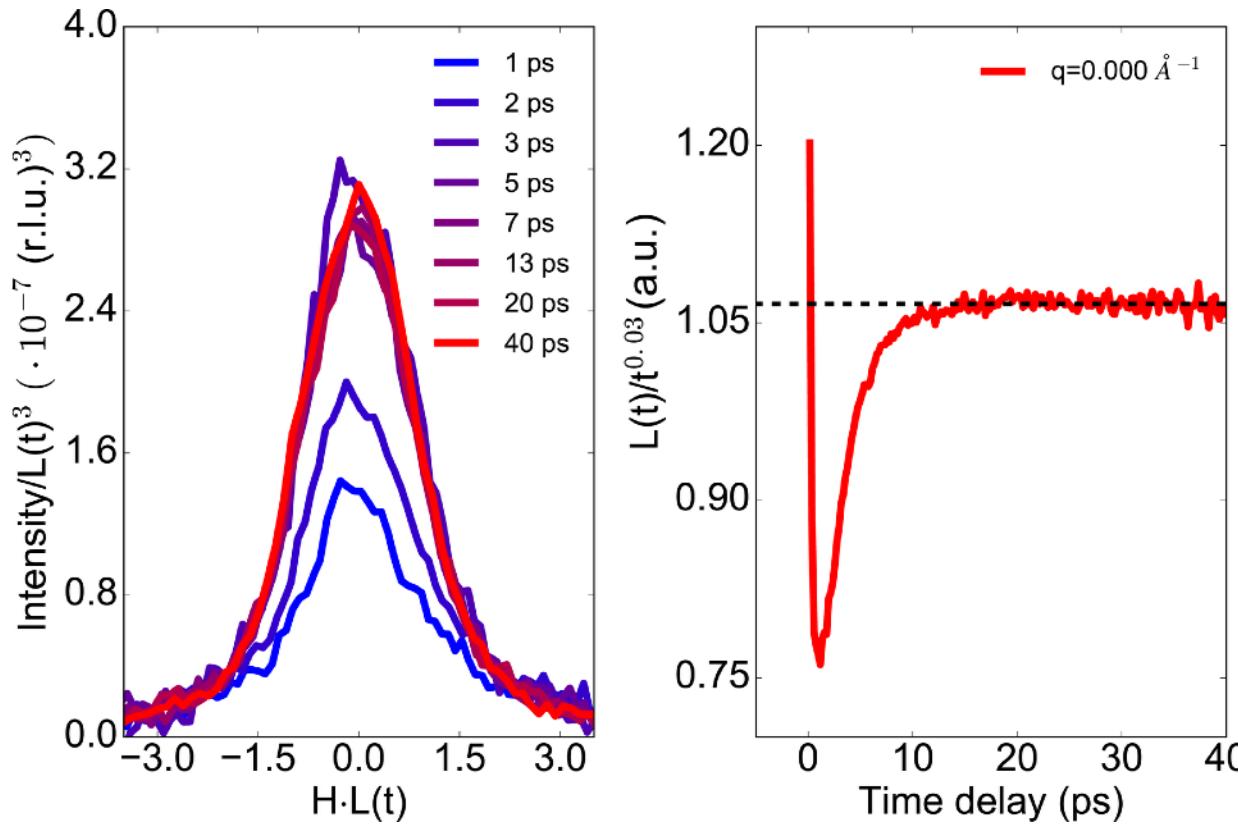

- block copolymers
- binary alloys

e.g. Gaulin et al. PRL 59, 668 (1987)
Harrison et al. Science 290, 1558 (2000)

- CO obeys dynamic critical scaling towards equilibrium

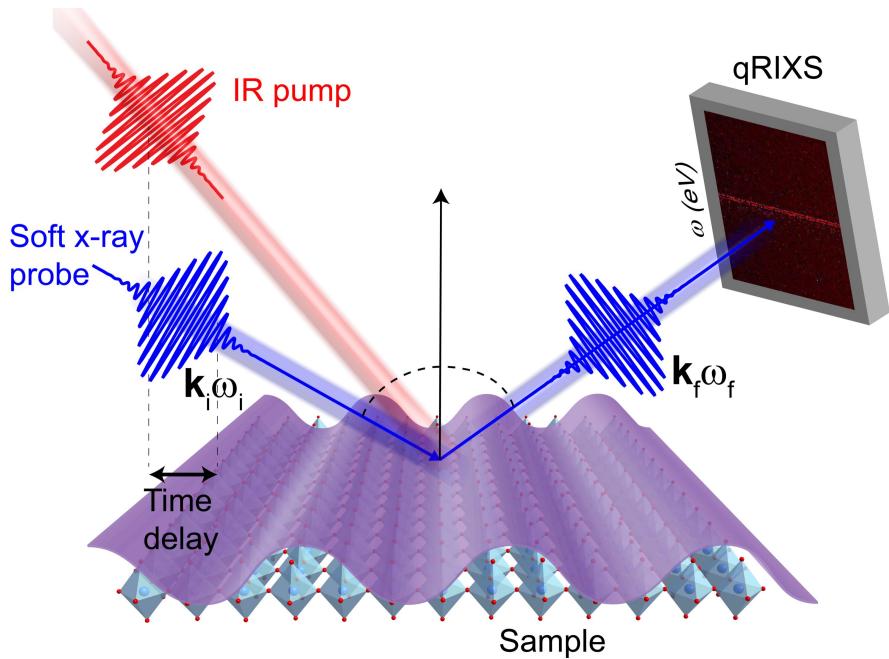

$$S(q,t) = L(t)^3 F(qL(t))$$

Dynamic critical scaling and defects

- CO obeys dynamic critical scaling towards equilibrium
$$S(q,t) = L(t)^3 F(qL(t))$$
- Propagation of topological defects $L(t) \sim \ln(t)$

Conclusions

- LBCO charge order is *dynamic*
- Gapless diffusive excitations
- Possible relevance to interstripe tunneling
