List of Acronyms

BNL	Brookhaven National Laboratory
D&D	Decontamination and Decommissioning
ESD	Environmental Services Division
ESH	Environment, Safety and Health
ft^2	Square feet
HVAC	Heating, Ventilating and Air Conditioning
JTA	Job Training Assessment
Linac	Linear Accelerator
LOQ	Limit of Quantification
MER	Mechanical Equipment Room
NSLS	National Synchrotron Light Source
Pb	Lead
PPE	Personal Protective Equipment
PS	Photon Sciences
PWGC	P.W. Grosser Consulting, Inc.
QA	Quality Assurance
QC	Quality Control
RF	Radio Frequency
RL	Reporting Limit
SAD	Safety Assessment Document
ug	Microgram
VUV	Vacuum Ultraviolet

1.0 PURPOSE

P.W. Grosser Consulting, Inc. (PWGC) has prepared the following Surface Metals Characterization Report to detail the findings of the surface metals characterization at the National Synchrotron Light Source (NSLS). This scope of work was based on the *Statement of Work for the Non-Radiological Characterization Planning and Implementation for NSLS Transition-Hazard Removal Project*. The metals survey was conducted in order to support the characterization of the NSLS facility; specifically, the objective was to survey the facility for surface metal contamination to determine:

- Hazards to personnel and impacts to planned demolition and removal activities;
- Impacts to the packaging, transportation and disposition of removed materials, equipment and waste;
- Impacts to re-purposing the NSLS facility; and
- Impacts and/or threats to the environment.

This metals survey is part of a comprehensive non-radiological characterization of the NSLS facility. An evaluation of the results of this metals survey, as well as the characterization of other non-radiological hazards (e.g., stored energy, laboratory chemicals, nanomaterials, etc.) will be documented in the general facility characterization report.

2.0 SITE DESCRIPTION AND HISTORY

According to LS-NSLS-0012, *NSLS Safety Assessment Document (SAD)*, the NSLS was a large user facility dedicated to the production and utilization of synchrotron radiation. It supported the development of electron-based radiation sources and new applications of this radiation in the physical and biological sciences. Ground was broken in 1979 for construction and first beam was delivered in 1982. The NSLS ended operations on September 30th, 2014. Building 725, which houses the NSLS, is located in the eastern region of the BNL site.

According to LS-NSLS-0012, *NSLS Safety Assessment Document (SAD),* the current configuration of Building 725, which has two stories, is the result of a series of upgrades over the years. The first floor (123,644 sq. ft.) consists largely of the experimental floor and support equipment, and is constructed below grade. This includes the linac, booster synchrotron, VUV ring, X-Ray ring, beamlines, operational control and power systems, laboratories, offices, machine shops, storage and setup areas, stockroom and delivery areas, and a library. The stockroom and VUV floor are serviced by a total of three 4,000 lb. capacity overhead bridge & trolley cranes, and the booster ring is serviced by a 2,000 lb. capacity jib crane. The second floor (38,512 sq. ft.) consists largely of office space and conference rooms, as well as machine shops. Both floors have a number of mechanical equipment rooms. The layout of both floors of Building 725 is illustrated in **Figure 1** and **Figure 2**.

Similar construction has been used in each upgrade. The floor is poured concrete. Exterior walls are insulated metal panels. The roof is an insulated metal deck, originally a Factory Mutual Class I built-up tar roof system.

Exposed metal frames support the structure, except in the perimeter. The perimeter of the facility has a two-story office mezzanine constructed of poured concrete on metal deck.

According to previous lead investigations summarized in *Summary Report of Evaluation of Lead Contamination in NSLS, National Synchrotron Light Source, Upton, New York* (Photon Sciences, August 24, 2012), uncoated lead was widely used for radiation shielding at the NSLS facility. Lead shielding configuration changes resulted in movement of lead bricks throughout many areas of the first floor, as well as lead machining in some of the laboratories and Tech Areas. In addition, lead soldering was performed in laboratories and Tech Areas on both the first and second floors of Building 725.

According to interviews with previous NSLS staff, beryllium was used in accelerator and beamline components, and beryllium windows were mistakenly broken on the first floor. Other metals (e.g., cadmium, manganese, etc.) were cut and soldered in laboratories and Tech Spaces, as well as used in other applications to support research activities.

Additional descriptions of the facility, including building utility systems, accelerator systems, and radiation protection systems are documented in LS-NSLS-0012, *NSLS Safety Assessment Document (SAD)*.

3.0 PREVIOUS INVESTIGATIONS

Measureable surface lead contamination has been previously detected at the NSLS facility during surveys performed by PS ESH Staff to assess hazards for occupational workers, as documented in the *Summary Report of Evaluation of Lead Contamination in NSLS, National Synchrotron Light Source, Upton, New York* (Photon Sciences, August 24, 2012). Areas where lead contamination was detected include the Experimental Floor, Tech Areas and Laboratories on the first floor of Building 725, with highest concentrations detected in the Machine Shop (Room 1-124) and on the more inaccessible areas of the beamline aisle floors (i.e., under the beam tubes). Lead was detected at concentrations as high as 2,000 ug/ft^2 in wipe samples collected from these areas. Locations of elevated surface lead contamination appear to be associated with past activities, such as lead soldering, shielding configuration changes and routine movement of lead bricks associated with plug door movements.

Cadmium and manganese were detected on Building 725 first floor surfaces at concentrations greater than the equipment release standards provided in Table 3 of BNL-IH75190, *Surface Wipe Sampling Procedure*. These results are documented in an analytical report provided by Liberty Mutual Industrial Hygiene Laboratory, dated October 9th, 2012. According to the report, the associated wipe samples were collected on September 20, 2012.

Additional lead surveys are being performed by PS ESH Staff to support ongoing equipment removal and stabilization activities at the NSLS facility, which were initiated after operations ended on September 30th, 2014. These surveys are being performed mainly on equipment that is being removed from the first floor experimental

areas and laboratories. The results of these surveys are being assessed as they are made available. To date, lead wipe survey results performed on equipment being removed have ranged from below detection limits to as high as 551.7 ug/ft^2.

There is no current knowledge of previous metal surveys performed on the second floor of Building 725.

4.0 CONTAMINANTS OF CONCERN

Lead was identified as the primary metal contaminant of concern based upon knowledge of historical operations, as well as the August 2012 *Summary Report of Evaluation of Lead Contamination in NSLS, National Synchrotron Light Source*. Additional metal contaminants of concern (**Table 4.1**) were derived from the list of metals evaluated in the analytical report provided by Liberty Mutual Industrial Hygiene Laboratory, dated October 9th, 2012, as well as from knowledge of historical and ongoing activities.

Table 4.1

Additional Metal Contaminants of Concern

Aluminum	Calcium	Magnesium	Thallium
Antimony	Chromium	Manganese	Tin
Arsenic	Cobalt	Mercury	Titanium
Beryllium	Copper	Nickel	Vanadium
Cadmium	Iron	Selenium	Zinc

5.0 PROJECT SCOPE AND FIELD PROCEDURES

Wipe samples were collected to characterize the extent of lead contamination, as well as additional metals of concern, on representative surfaces throughout the NSLS facility. Wipe sample collection was performed by a field engineer who was previously trained in the required sampling protocol: HP-IHP-51200, *IH Lab Equipment and Sample Processing* and HP-IHP-75190, *Surface Wipe Testing*. Samples were collected in accordance with BNL-IH5190 *Surface Wipe Sampling Procedure* and based upon direction provided by BNL Safety & Health Services Division Industrial Hygiene (IH) personnel. Wipe samples were delivered by the field engineer to BNL IH personnel under BNL-IH51300 *Chain or Custody* procedures for packaging and shipment to their contracted analytical laboratory. Both Liberty Mutual IH Laboratory (Liberty) and EMSL Analytical (EMSL) performed wipe sample analysis for this characterization effort.

5.1 Sample Locations

For the purpose of this characterization survey, the NSLS facility was divided into the following five area groups, which are illustrated in **Figure 1** and **Figure 2**:

- Accelerator systems;

- First floor rooms (offices, labs, tech space, mechanical equipment rooms (MERs), lounges, hallways, bathrooms, and storage areas);
- The experimental floor (general area);
- Second floor; and
- Heating ventilation and air-conditioning (HVAC) ductwork.

The frequency, distribution, and location of wipe samples were planned based upon information collected during interviews and facility walkthroughs with PS staff and subject matter experts, as well as the review of facility drawings and reports. This information includes historical operations throughout the facility, HVAC system design, and the likelihood of surfaces to remain undisturbed (i.e., dusty surfaces, such as bookshelves, tops of experimental hutches, etc.). Specific criteria considered when choosing wipe sample locations in each of the five area groups are discussed in the following subsections. Actual sample locations were subject to field observations and professional judgment of the field engineer and are illustrated in **Figure 3** (1st floor) and **Figure 4** (2nd floor).

5.1.1 *Accelerator Systems*

Accelerator Systems that previously operated at the NSLS facility include the Gun area, Klystron Gallery, Linac enclosure, Booster Ring enclosure, VUV Ring area and the X-Ray Ring tunnel. Lead shielding configurations are currently still in place in these areas. Wipe samples were collected from:

- Areas where dust is not frequently disturbed (e.g., elevated surfaces, top of equipment, floors beneath equipment, etc.);
- Floors and/or ledges adjacent to lead shielding configurations; and
- HVAC return vents, where easily accessible.

Wipe sample locations were chosen based on spatial coverage and historical operations (i.e., movement of uncoated lead). Accelerator systems were surveyed via wipe sample collection at a minimum frequency of five samples in each accelerator system area. The sample frequency for the accelerator systems and the associated analytes are summarized in **Table 5.1** Sample locations are illustrated on **Figure 3** and photographs of sample locations are available in the *NSLS Surface Metals Characterization Sampling Photo Log* (PWGC, November 2014).

Table 5.1

Summary of Accelerator Systems Wipe Sample Locations

Area	Sample Location Description	No. of Samples for Lead Only	No. of Samples for Lead and Table 4.1 Metals[1]	No. of Samples for Mercury	Total
Gun/Linac/Booster/Klystron Gallery	Top of equipment rack, file cabinet, and concrete block near shielding	5	1	1	**7**
VUV Ring	Top of VUV ring equipment and racks	5	1	1	**7**
X-Ray Ring	Top of x-ray ring equipment, magnets, wall ledge, and floor.	7	1	1	**9**
QA Blank Samples		0	2	2	**4**
Total		**17**	**5**	**5**	**27**

Note: 1- Sampling for Table 4.1 Metals requires the collection of two wipe samples: one Whatman 42 for mercury and one GhostWipe™ for the remaining metals. Therefore, mercury samples are counted in a separate column.

5.1.2 *First Floor Rooms (Offices, Labs, Tech Spaces, MERs, Lounges, Hallways, Bathrooms and Storage Areas)*

The first floor rooms, which are primarily located along the outer perimeter of the Experimental Floor, supported an assortment of activities. These rooms include offices, labs, tech spaces, storage areas, mechanical equipment rooms (MERs), conference rooms, and bathrooms. Corridors (i.e., hallways) outside of the Experimental Floor were also included in this group. The first floor rooms are presently in a state of flux as NSLS users and BNL staff prepare equipment, material, and supplies for disposition or removal during stabilization activities.

Wipe sample locations were chosen based on spatial coverage, however they were primarily based on knowledge of historic operations that took place in these rooms. For example, wipe sample locations were biased to rooms where lead cutting, soldering and staging took place, as well as rooms with fume hoods. These rooms include labs, tech spaces and the Lead Laydown Area (Area 3 – 1-123). For comparison, wipe sample locations were also chosen in areas assumed to be "clean" (i.e., isolated from lead operations and laboratory activities). These assumed "clean" areas included the Building 725 Lobby and a first floor bathroom. First floor rooms were surveyed via wipe sample collection at a minimum frequency of one out of every five rooms.

Specifically, wipe samples were collected from:

- Areas where dust is not frequently disturbed (e.g., tops of bookcases, cabinets, and vending machines);
- Work benches in labs and Tech Spaces;
- Inside fume hoods in labs;
- Surfaces where metal shavings were observed;
- HVAC return vents and;
- Overhead crane located in LEGS (1-168); and
- Floors.

The sample locations and frequency for the first floor rooms and hallways, as well as the associated analytes, are summarized in **Table 5.2**. Sample locations are illustrated on **Figure 3** and photographs of sample locations are available in the *NSLS Surface Metals Characterization Sampling Photo Log* (PWGC, November 2014).

Table 5.2
Summary of First Floor Rooms Wipe Sample Locations

Area	Sample Location Description	No. of Samples for Lead Only	No. of Samples for Lead and Table 4.1 Metals[1]	No. of Samples for Mercury	Total
Lobby (1-192)	Top of Vending Machines	2	0	0	**2**
Control Room (1-181)	Top of bookshelf, wall ledge	2	0	0	**2**
Tech Shop (1-171)	Top of cabinet, workbench	2	0	0	**2**
LEGS (1-168)	HVAC return vent, wall ledge, overhead crane	3	0	0	**3**
Confirmed Pb Solder Station (1-167)	Top of cabinet, workbenches	3	0	0	**3**
User Shop (1-124A)	Floor-adjacent to lathe, top of workbench	2	0	0	**2**
1-163	Storage rack, top of workbench	2	0	0	**2**

Area	Sample Location Description	No. of Samples for Lead Only	No. of Samples for Lead and Table 4.1 Metals[1]	No. of Samples for Mercury	Total
Men's Bathroom (1-156)	Ceiling diffuser, top of radiator	2	0	0	**2**
1-154	Top of workbench, bookshelf	2	0	0	**2**
West Roll-up Door Area (1-151A)	Floor-adjacent to roll-up door, top of equipment	2	0	0	**2**
Area 1 User Storage (1-151)	Top of storage rack, corner of floor	2	0	0	**2**
Lab (1-146)	Top of workbench, top of haz. storage cabinet	2	0	0	**2**
SU Lab 1 (1-123A)	Floor beneath band saw, top of equipment cart, top of workbench	3	0	0	**3**
Area 3 (1-123)	Adjacent to floor drain, top of haz. storage cabinet, middle area floor	2	1	1	**4**
Stock Room (1-116)	Top of vacuum parts rack, entryway floor	2	0	0	**2**
1-110C	Top of bookshelf, floor-in front of cabinet	2	0	0	**2**

Area	Sample Location Description	No. of Samples for Lead Only	No. of Samples for Lead and Table 4.1 Metals[1]	No. of Samples for Mercury	Total
1-107	Floor entryway, top of cabinet, top of workbench	3	0	0	**3**
1-103	Floor-middle area, top of cabinet	2	0	0	**2**
MERs	Top of equipment, floor, top of cabinet, top of workbench	6	0	0	**6**
Hallway Floors	Along wall, corner, user experimental area	5	0	0	**5**
QA Blank Samples		4	2	2	**8**
QA Duplicate Samples		0	1	1	**2**
Total		**55**	**4**	**4**	**63**

Note: 1- Sampling for Table 4.1 Metals requires the collection of two wipes: one Whatman 42 for mercury and one GhostWipe™ for the remaining metals. Therefore, mercury samples are counted in a separate column.

5.1.3 *Experimental Floor (General Area)*

Wipe sample locations were limited in the Experimental Floor (General Area) due to equipment disposition and stabilization activities that are currently ongoing throughout that area. Samples were biased to elevated surfaces (e.g., ledges, shelves, cabinets, etc.) since the floor surface conditions are in a state of flux. Additionally, wipe samples were collected from surfaces along the elevated walkways above both the X-Ray ring and the VUV Ring, as well as on the tops of experimental hutches.

The sample frequency for areas throughout the Experimental Floor (General Area) and the associated analytes are summarized in **Table 5.3**.

Table 5.3

Summary of Experimental Floor (General Area) Wipe Sample Locations

Area	Sample Location Description	No. of Samples for Lead Only	No. of Samples for Lead and Table 4.1 Metals[1]	No. of Samples for Mercury	Total
X-Ray Ring Experimental Floor	Top of equipment, top of doorway, user floor area	3	1	1	**5**
X-Ray Ring Elevated Walkway	Top of X6B hutch	1	0	0	**1**
VUV Ring Experimental Floor	Top of wall ledge	1	0	0	**1**
VUV Ring Elevated Walkway	Metal surface off elevated catwalk	1	0	0	**1**
Electrical Shop (1-204)	Floor along wall, top of cabinet	2	0	0	**2**
Power Supply Test Area (1-205)	Top of workbench, equipment shelf	2	0	0	**2**
Booster Quad Area (1-201)	Floor-behind electrical equipment, top of electrical j-box	1	1	1	**3**
RF Equipment Room (1-200)	Top of equipment, floor beneath rack	4	0	0	**4**
QA Blank Samples		1	0	0	**1**
Total		**16**	**2**	**2**	**20**

Note: 1- Sampling for Table 4.1 Metals requires the collection of two wipes: one Whatman 42 for mercury and one GhostWipe™ for the remaining metals. Therefore, mercury samples are counted in a separate column.

5.1.4 *Second Floor/RF Penthouse*

With the exception of second floor workshops (Rooms 190A through 190E) and tech spaces (Rooms 124B, 124C, 124D, 124E and 124G), there is no current knowledge of metals contamination on the second floor of Building 725; however, it has been noted that portions of the second floor exchange airflow with the first floor through the building's HVAC system. This area is referred to as "A/C 6" on **Figure 4**. The majority of the second floor consists of office space, hallways and conference rooms. In addition, there are two MERs (Room 175 and Room 209), second floor workshops (Rooms 190A through 190E), tech spaces (Rooms 124B, 124C, 124D, 124E and 124G), and bathrooms (Rooms 105, 107, 171 and 173). Additionally, the RF Penthouse is accessible from the second floor roof exit.

Wipe sample locations were biased to the hallways and offices in the A/C 6 area, MERs, workshops and the tech space. Samples were taken at a lower frequency in office areas and hallways that do not directly exchange air with the first floor (e.g., A/C 3 and A/C 10 as shown on **Figure 3**). Specifically, second floor rooms were surveyed via wipe sample collection at a minimum frequency of one out of every ten offices in the A/C 3 and A/C 10 areas, and at a minimum frequency of one out of every five rooms in the A/C 6 area. Wipe samples were collected from the following locations within offices, rooms and hallways:

- Areas where dust is not frequently disturbed (e.g., tops of bookcases);
- Work benches in workshops and tech space
- HVAC diffusers in the A/C 6 area; and
- Floors

The sample frequency for areas throughout the second floor of Building 725 and the associated analytes are summarized in **Table 5.4**. Sample locations are illustrated on **Figure 4** and photographs of sample locations are available in the *NSLS Surface Metals Characterization Sampling Photo Log* (PWGC, November 2014).

Table 5.4

Summary of Second Floor/RF Penthouse Wipe Sample Locations

Area	Sample Location Description	No. of Samples for Lead Only	No. of Samples for Lead and Table 4.1 Metals[1]	No. of Samples for Mercury	Total
A/C 3 Rooms	Ceiling diffusers, floors-along walls, representative surfaces	6	1	1	**8**

Area	Sample Location Description	No. of Samples for Lead Only	No. of Samples for Lead and Table 4.1 Metals[1]	No. of Samples for Mercury	Total
A/C 3 Hallways	Ceiling diffusers, floors	2	0	0	**2**
A/C 6 Rooms	Ceiling diffusers, floors-along walls, representative surfaces	56	1	1	**58**
A/C 6 Hallways	Ceiling diffusers, floors	8	0	0	**8**
A/C 8 Rooms	Ceiling diffusers, floors, representative surfaces	4	1	1	**6**
Covered Walkway (2-192A)	Floor-center of hallway	1	0	0	**1**
MER No. 4 (2-175)	Top of AC equipment	0	1	1	**2**
MER No. 6 (2-209)	Top of AC equipment	0	1	1	**2**
Tech Area (2-124B through 2-124E)	Top of workbenches, floor adjacent to fume hood	4	1	1	**6**
Workshop (2-190A through 2-190E)	Top of workbenches, top of cabinet, counter top	4	1	1	**6**
RF Penthouse on Roof (122)	Top of electrical equipment box	1	0	0	**1**

Area	Sample Location Description	No. of Samples for Lead Only	No. of Samples for Lead and Table 4.1 Metals[1]	No. of Samples for Mercury	Total
QA Blank Samples		7	3	1	**11**
Total		**93**	**10**	**8**	**111**

Note: 1- Sampling for Table 4.1 Metals requires the collection of two wipes: one Whatman 42 for mercury and one GhostWipe™ for the remaining metals. Therefore, mercury samples are counted in a separate column.

5.1.5 *HVAC Ductwork*

Multiple facility walkthroughs with the HVAC engineer assigned to NSLS were performed to assist in choosing the associated wipe sample locations. As briefly discussed in Section 5.1.4, the Building 725 HVAC system is divided into "A/C" sections. As illustrated on **Figure 3** and **Figure 4**, there are 16 A/C sections throughout the building including the Leibert Package unit located in the RF equipment room (1-200). No ductwork services the Leibert Package and therefore no samples were collected from this A/C section. Wipe sample locations were initially biased to A/C sections that handle air where lead shielding configuration changes were likely common, areas where excess lead bricks were staged and moved/removed, where lead cutting was performed, and where air is exchanged with the second floor. These A/C sections included the following:

- A/C-1 – West half experimental area and X-Ray Ring tunnel;
- A/C-2 – East half experimental area and X-Ray Ring tunnel;
- A/C-4 – VUV Ring: high bay area;
- A/C-5 – Linac, Booster ring, and lobby;
- A/C-6 – 1st floor offices north side and second floor lobby northeast offices past north elevator, and;
- A/C-7 – 1st floor: MER 4 south to lobby. Includes Lead Laydown Area (Area 3 – 1-123).

Based upon the initial HVAC system characterization results, it was decided that characterization of the remaining HVAC systems was necessary. Many contaminants of concern were not detected in the initial HVAC characterization; therefore, a subset of eight analytes (**Table 5.5**) was selected.

Table 5.5

Remaining HVAC Metal Contaminants of Concern

Beryllium	Cadmium	Chromium	Lead
Manganese	Cobalt	Silver	Zinc

Silver, which was not originally identified as a contaminant of concern, was added based upon a subsequent review of notes from a facility walkthrough (McQueen, VUV Beamlines Walkthrough, October 9, 2014) and a facility characterization survey response that was completed as part of the NSLS Transition and Hazard Removal

Project (Nintzel, Facility Characterization Survey, December 9, 2014). Both of these sources indicated the historic use of silver solder in the facility.

The remaining A/C sections included the following:

- A/C-3 – 2nd floor offices north west of lobby;
- A/C-8 – 2nd floor north offices west of north elevator;
- A/C-9 – LEGs or gamma ray facility (1-168)
- A/C-10 – RF Penthouse;
- A/C-11 – Machine shop outside MER 2;
- A/C-12 – Technicians area south of breeze way;
- A/C-14 – Library;
- A/C-16 – Structural biology north of LEGs (by MER 8);
- A/C-17 – Structural biology east of LEGs (by MER 7).

Within these A/C sections, wipe sample locations were chosen at accessible points of air return and diffuser ductwork. The sample locations for the Building 725 ductwork and the associated analytes are summarized in **Table 5.5**. Sample locations are illustrated on **Figure 4** and photographs of sample locations are available in the *NSLS Surface Metals Characterization Sampling Photo Log* (PWGC, January 2015).

Table 5.6
Summary of HVAC Ductwork Sample Locations

Duct Wipe Sample Location	Sample Location Description	No. of Samples for Lead Only	No. of Samples for Lead and Table 4.1 Metals[1]	No. of Samples for Mercury	No. of Samples Table 5.5 Metals	Total
A/C 1 (1-201)	Inside hatch on overhead return duct downstream of RF Area	1	0	0	0	**1**
A/C 2 (1-207)	Inside hatch on overhead return duct inside MER-2	1	0	0	0	**1**

Duct Wipe Sample Location	Sample Location Description	No. of Samples for Lead Only	No. of Samples for Lead and Table 4.1 Metals[1]	No. of Samples for Mercury	No. of Samples Table 5.5 Metals	Total
A/C 5 (1-115)	Inside hatch on return duct inside MER 3	1	0	0	0	**1**
A/C 4	Inside hatch on overhead return duct near Hutch X-25	1	0	0	0	**1**
A/C 7 (1-123)	Diffuser hatch located in lead laydown area	1	0	0	0	**1**
A/C 7 (1-123)	Inside hatch on return located inside MER-4	1	0	0	0	**1**
A/C 6 (1-121)	Inside return hatch located in MER-4	0	1	1	0	**2**
A/C 3 (1-115)	Inside hatch on return duct located in MER-3	0	0	0	1	**1**
A/C 8 (2-209)	Inside hatch on return duct located in MER-6	0	0	0	1	**1**
A/C 9 (1-168)	Inside hatch on return duct located in LEGs mezzanine	0	0	0	1	**1**

Duct Wipe Sample Location	Sample Location Description	No. of Samples for Lead Only	No. of Samples for Lead and Table 4.1 Metals[1]	No. of Samples for Mercury	No. of Samples Table 5.5 Metals	Total
A/C 10 (2-122)	Inside return panel of AH10A located in RF Penthouse	0	0	0	1	**1**
A/C 11 (Roof)	Inside hatch on return duct	0	0	0	1	**1**
A/C 12 (Roof)	Inside hatch on return duct	0	0	0	1	**1**
A/C 14 (1-110D)	Inside hatch on return duct	0	0	0	1	**1**
A/C 16	Inside hatch on return duct located in MER-8	0	0	0	1	**1**
A/C 17 (1-172A)	Inside hatch on return duct located in MER-7	0	0	0	1	**1**
QA Blank Samples		0	1	1	2	**4**
Total		**6**	**2**	**2**	**11**	**21**

Note: 1- Sampling for Table 4.1 Metals requires the collection of two wipes: one Whatman 42 for mercury and one GhostWipe™ for the remaining metals. Therefore, mercury samples are counted in a separate column.

5.2 Sample Summary

The total number of collected wipe samples is presented in **Table 5.6**. This table also includes a summary of Quality Assurance (QA)/Quality Control (QC) samples, which are further discussed in Section 5.3.

Table 5.7

5.3 Quality Assurance/Quality Control

Proper QA and QC procedures were followed in the field and at the laboratory to ensure that reliable data was obtained. While performing field sampling, care was taken to prevent the cross-contamination of non-dedicated sampling equipment that could compromise sample integrity. QA/QC samples were collected in accordance with BNL-IH75190, *Surface Wipe Sampling Procedure* and/or based upon direction from BNL IH personnel.

Overall, QA blank samples were collected at a frequency of approximately one per 8 samples, while QA duplicate samples were collected at a rate of approximately one per 100 samples. The distribution and total number of QA/QC samples is presented in **Table 5.7**.

Table 5.8

Summary of QA/QC Samples

Sample Group Area	No. of Blank Sample for Lead Only	No. of Blank Samples for Lead and Table 4.1 Metals[1]	No. of Blank Samples for Mercury	No. of Samples Table 5.5 Metals	No. of Duplicate Samples for Lead and Table 4.1 Metals	No. of Duplicate Samples for Mercury	Total

5.4 Laboratory Analysis

Wipe samples were submitted by BNL Safety & Health Services Division IH personnel to both Liberty and EMSL for analysis. Analytical results are fully documented in the following analytical reports:

- Liberty Mutual Industrial Hygiene Laboratory Analytical Reports: 1410204 dated October 29, 2014, 1410205 dated October 30, 2014, and 1410206 dated October 30, 2014.
- EMSL Analytical, Inc. Laboratory Reports: 011406203 dated November 19, 2014, 011406226 dated November 20, 204 and 011407014 dated January 8, 2015.

5.5 Sample Identification

Each sample was identified by a set of information relating individual sample characteristics in accordance with BNL-IH75190, *Surface Wipe Sampling Procedure*. Required information consists of building number, date (MMDDYY), analyte symbol (e.g., M for metals) and sample number. An example of appropriate sample identification is as follows:

- **725-101514-M-001**

5.6 Chain-of-Custody, Sample Packaging and Shipment

Samples and associated field sampling forms were delivered to BNL Safety & Health Services Division IH personnel under BNL-IH51300 *Chain or Custody* procedures for packaging and shipment. BNL IH personnel completed the necessary laboratory chain-of-custody forms, packaged, and shipped samples to the analytical laboratories for the requested analysis. Samples were packaged and shipped in a manner that maintained sample preservation requirements during transport, ensured that sample holding time could be achieved, and prevented samples from being tampered with.

Samples were shipped using the commercial carrier FedEx. Commercial carriers are not required to sign the chain-of-custody as long as it is enclosed in the shipping container and evidence tape (custody seal) remains in place on the shipping container. Chain of custody documentation is available in the NSLS Surface Metals Characterization Chain-of-Custody Records, January 2015.

5.7 Field Equipment Calibration

The use of field equipment that would require calibration was not utilized for this project.

5.8 Equipment Decontamination

Non-dedicated sampling equipment, such as reusable templates and scissors, were thoroughly cleaned using GhostWipes™ prior to and between sampling locations. Gloves were changed out between samples by pulling them off inside-out and discarding them appropriately before handling the next wipe.

5.9 Management of Investigation Derived Waste

In accordance with Attachment 9.5 of IH75190, *Surface Wipe Sampling Procedure*, personal protective equipment (PPE) and paper templates generated during wipe sampling operations were disposed of as non-hazardous waste (i.e., normal trash). The wipe samples themselves will be consumed in the analysis at the end of the test by the offsite analytical laboratories.

5.10 Documentation

5.10.1 *Field Documentation*

The Surface Contamination Sampling Form (Attachment 9.3 of BNL – IH75109, *Surface Wipe Sampling Procedure*) was used to document wipe sample information (e.g., location, identification, analyte, etc.). In addition, a dedicated site logbook was used to document daily field activities. Permanent black or blue ink was used to record information on the form and in the logbook. Errors in field documentation were lined through, initialed, dated, and corrected. The logbook contains waterproof pages that are consecutively numbered, and are permanently bound with a hard cover. Upon completion of daily activities, unused portions of pages were lined-through and initialed. All entries in the field logbook were recorded and dated by the field engineer. Copies of the Surface Contamination Sampling Form and the daily log entries are included available in the NSLS Surface Metals Characterization Sampling Forms and Daily Log (PWGC, January 2015).

In addition, field personnel photographed each wipe sample location and maintain an associated photo log so that the sample locations may be revisited. The photo log and photographs are documented in the *NSLS Surface Metals Characterization Sampling Photo Log* (PWGC, January 2015).

5.10.2 *Records Management*

Liberty and EMSL analytical laboratories provided analytical data reports, which will be maintained by BNL in accordance with BNL SBMS Subject Area, *Records Management*.

6.0 RESULTS

Wipe sample results were compared to both the Housekeeping and Equipment Release criteria in Table 3 of BNL IH75190, *Surface Wipe Sampling Procedure* to determine impacts to future decontamination and decommissioning (D&D) activities, to aid in decision-making relative to re-purposing the facility, and to assess any potential threats to the environment.

6.1 Metals Results Summary

Surface metal wipe sampling conducted at the NSLS facility identified lead above the BNL IH75190 Surface Wipe Criteria for Lead Operational Areas (250 µg/ft^2) on the 1st floor periphery, experimental floor, and accelerator enclosures; with levels as high as high as 7,900 µg/ft^2, 8,800 µg/ft^2 and 40,000 µg/ft^2, respectively. Lead was detected above the BNL IH75190 Surface Wipe Criteria for non-Lead Operational Areas (40 µg/ft^2) in the offices and rooms of the second floor and RF penthouse, with a maximum of 1,600 µg/ft^2 in the workshop located in room 2-190A. In addition, quantifiable levels of lead were detected on ductwork surfaces in each of the 15 remaining A/C sections, with a maximum of 1,200 µg/ft^2 found inside the return hatch of A/C 1.

Lead results associated with the metals wipe survey are summarized below in Table 6.2. Complete results are provided in the Surface Metals Characterization Report (**Attachment B**).

Table 6.2

Lead Results Summary

Area	Lead Results
Accelerator Systems	20 of 20 samples with quantifiable levels 180 µg/ft^2 to 8,700 µg/ft^2 lead range (typical) 40,000 µg/ft^2 maximum
1st Floor Rooms	52 of 52 samples with quantifiable levels 110 µg/ft^2 to 1,500 µg/ft^2 lead range (typical) 7,900 µg/ft^2 lead maximum
Experimental Floor (General Area)	17 of 17 with quantifiable levels 110 µg/ft^2 to 750 µg/ft^2 lead range (typical) 8,800 µg/ft^2 lead maximum
2nd Floor/RF Penthouse	88 of 93 samples with quantifiable levels 1.1 µg/ft^2 to 110 µg/ft^2 lead range (typical) 1,600 µg/ft^2 lead maximum
HVAC Ductwork	16 of 16 samples with quantifiable levels 59 µg/ft^2 to 920 µg/ft^2 lead range (typical) 1,200 µg/ft^2 lead maximum

Surface metal wipe sampling conducted at the NSLS facility identified several other metals above their corresponding BNL IH75190, *Surface Wipe Criteria for Metals* in various locations within the facility, as described below:

- Cadmium was identified in each of the five sample group areas (i.e., accelerator systems, first floor rooms, experimental floor, second floor rooms/RF Penthouse and the HVAC ductwork). It should be noted that, in general, where lead was detected and samples were analyzed for additional metals of concern, cadmium was also detected.
- Manganese was identified in the experimental floor sample group area;
- Silver was identified in the HVAC ductwork sample group area;
- Cobalt was identified in the 2-190 workshop located in the second floor rooms sample group area; and
- Mercury was detected above its respective analytical laboratory reporting limit in each of the sample group areas.

Analytical results for metals are provided in their entirety, with results above their respective BNL IH75190 Surface Wipe Criteria highlighted, at the end of this report in Table 6.1 Sample locations, as well as analytical results above their respective BNL IH75190 Surface Wipe Criteria, are also illustrated in **Figure 3** and **Figure 4.** Sample location photographs are available in the *NSLS Surface Metals Characterization Sampling Photo Log* (PWGC, January 2015).

6.2 QA/QC Results Summary

Samples 001 through sample 106 were analyzed by Liberty Mutual Industrial Hygiene Laboratory. Liberty Mutual Industrial Hygiene Laboratory analytical report 1410204 indicated that QA blank samples 021 and 022 did not meet the quality control criteria for lead and therefore samples 001 through 020 were not blank corrected. Samples 023 through sample 106 (analytical reports 1410205 and 1410206) did meet quality control criteria and samples were blank corrected. QA blank sample results from analytical reports 1410205 and 1410206 were not found above their respective limit of quantification (LOQ).

Beryllium, cadmium, cobalt, chromium, manganese, antimony, molybdenum, nickel, and vanadium were detected in some samples analyzed by Liberty, which were only submitted for lead analysis. A request was submitted to Liberty on December 9, 2014 to revise the original analytical reports with the additional analytes. The revised reports are included as reference material to this report.
It should also be noted that samples 048, 049, and 050 were voided prior to analysis and samples 242, 243, 244 were held and not analyzed. The sample number sequence was not changed.

Samples 107 through 248 were analyzed by EMSL Analytical, Inc. EMSL analytical reports 011406203 and 011406226 indicated that aluminum, arsenic, calcium, copper, magnesium, tin, and zinc were detected in laboratory method blanks above their respective reporting limit (RL). EMSL analytical report 011407014 indicated that beryllium was outside the method control limits and zinc was detected in the method blank above the reporting limit. Results for these analytes, therefore, may be biased high. Generally, QA blank analytical results did not exceed their RL; however, analytes that did were not found at appreciably high levels. The analytical results for the two QA duplicate samples collected (233 and 234) were found to be comparable to their respective wipe samples (208 and 209). Obtaining repeatability of QA duplicate wipe sample results is problematic due to the fact that duplicate wipe samples cannot be collected from the same wipe surface, and are instead collected on surfaces adjacent to the original wipe sample location.

7.0 HEALTH AND SAFETY

Project personnel adhered to the facility requirements presented in Email correspondence from Lori Stiegler to Photon Sciences Personnel, dated October 16, 2014: *725 Facility Update*. The field engineer who performed wipe sample collection also followed the PPE requirements specified in IH75190, *Surface Wipe Sampling Procedure*. Additionally, the field engineer completed the Job Training Assessment (JTA) designated for wipe sample collection: HP-75C, *Surface Wipes Sampler for Toxic Metals*.

Zinc	NS	NS		<120	540							<120																<120	

Notes:

All sample results are reported in µg/ft2.

NS - No Standard

Blank cells denote the analyte was not analyzed for.

< - Non detect (no detectable result above the respective Limit of Quantification/Reporting Limit)

Yellow highlight denotes sample above its respective equipment release standard.

Red highlight denotes sample above its respective housekeeping standard
