Qualified Screener answers the following questions; if:

- Any question is answered yes (i.e., "Y"), check “Potential USI” box in Part C, above.
- If all questions are answered no (i.e., "N"), check “No potential USI” box in Part C, above.

Does the proposed change or discovered condition impact or potentially impact:

1) The personnel protection system (PPS)?
   Examples: Access doors, fencing, hutches, accelerator enclosures, software change, hardware modifications that are not, “replacement-in-kind.”
   ☑ Y or ☐ N

2) ODH Monitoring System?
   Examples: Hutch ODH monitors, filling station ODH monitors.
   ☑ Y or ☐ N

3) Radiation Safety Component?
   Examples: Shielding, earthen berms, hutches, concrete walls, beam shutters, scatter shields, burn-through devices, exclusion zones, labyrinths, beam stops, beam masks, collimators, hutch guillotine and beam transport pipes.
   ☐ Y or ☑ N

4) Area radiation monitoring system or components?
   Examples: Changing instrument position or use of a new type of instrument used for area radiation monitoring, alarms and controls.
   ☐ Y or ☑ N

5) Radiological source terms identified in the SAD?
Examples: New insertion devices, change to the maximum synchrotron energy or accelerated charge values, accelerator modifications that are not “replacement-in-kind.”
☐ Y or ☒ N

6) Critical devices
   Examples: Safety shutters, dipole magnets, top-off apertures.
   ☐ Y or ☒ N

7) PS operating organization?
   Examples: Control room operators, support staff responsible for PPS, radiation monitoring or shielding configuration management.
   ☐ Y or ☒ N

8) Operational safety limits described in the Authorization Basis Documents?
   Examples: Maximum current, beam energy, pulse rate.
   ☐ Y or ☒ N

Subject: Dose rates on contact with the New Beam Stop inside the Holography Chamber at 23ID-1 (CSX) Beamline

Date: July 17, 2018

This note describes the radiation analysis of the new monochromatic beam stop that is planned to be installed as part of the new holography chamber at 23ID-1 (CSX) beamline. The following storage ring and insertion device parameters [1] are used for the calculations herein:

- Electron Energy: 3 GeV
- Stored beam Current: 500 mA
- Elliptically Polarized Undulator Source:
  - Number of periods: 76
  - Period Length: 49.2 mm
  - Maximum Magnetic Field: 0.97 T

The analytical code STAC8 v. 2.3 [2] is used to estimate the dose rates on contact with copper beam stop. The monochromatic beam directly striking the monochromatic beam stop is conservatively simulated as a zero-order beam generated by a 3-mirror configuration (gold coated mirrors at 1.17 degrees angle of incidence) [1]. The current 23ID-1 beamline is equipped with a 2.75” diameter blank flange which acts as a monochromatic beam stop. The new holography chamber will be connected directly to 23ID-1 beamline by removing this blank flange and connecting to an upstream beam pipe with bellows. The fast CCD camera of the new chamber will be the new monochromatic beam stop for 23ID-1 and the monochromatic beam is completely stopped by the camera detector. There is a minimum of 3.56 mm thick Cu block covering the camera in addition to a thick cold finger made of copper just downstream of it [3].
The resulting dose rates on contact with the new beam stop are negligible (<0.001 mrem/h).
