

HBCU Workshop

National Synchrotron Light Source

NSLS Machine Introduction

Boris Podobedov
July 23, 2008

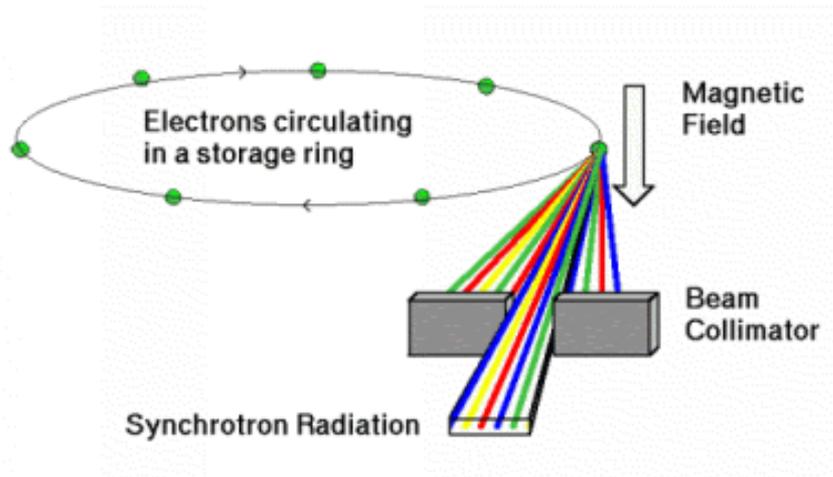

Outline

- Synchrotron Radiation (SR) Primer
 - SR definition & properties
 - Generation of SR
 - How to build a Synchrotron Light Source
- NSLS Machines
 - VUV ring
 - X-ray ring
 - Insertion Devices
 - ~~• Injection System, Vacuum, RF, power supplies, controls, ...~~
 - ~~• Beamlines and SR User Applications (talks to follow)~~
- Conclusions and outlook

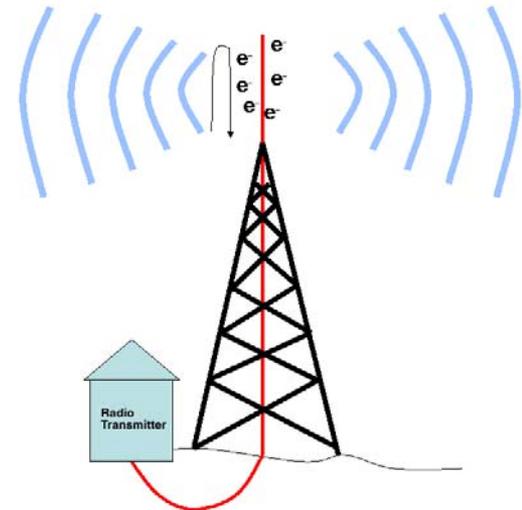

Thanks to many NSLS staff
& F. Sannibale (ALS) for
material used in this talk

Synchrotron Radiation

SR is EM radiation emitted when charged particles are radially **accelerated** (move on a curved path).

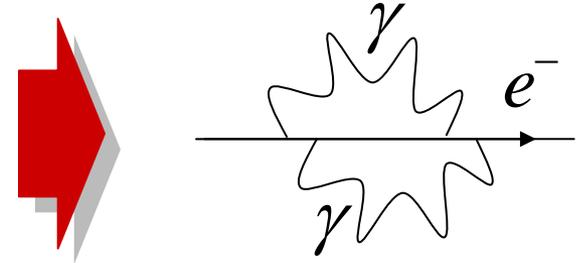

Electrons **accelerating** by running up and down in a radio antenna emit radio waves

Both cases are manifestation of the same physical phenomenon:
*Charged particles radiate when **accelerated**.*

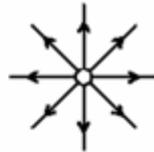

Why Do Particles Emit SR?

- A charge moving in free space is “surrounded” by a cloud of **virtual photons** that indissolubly travel with it.

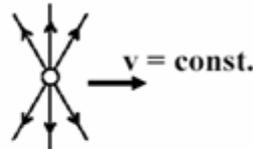

- When **accelerated**, the particle receives a “kick” separating it from the photons that become **real** and independently observable.
- Lighter particles are easier to accelerate so they radiate photons more efficiently
=> light sources use electrons

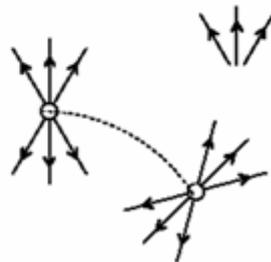

Charge at rest: Coulomb field

Uniformly moving charge

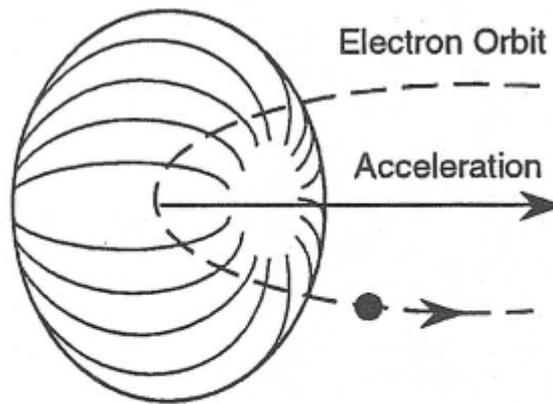

Accelerated charge

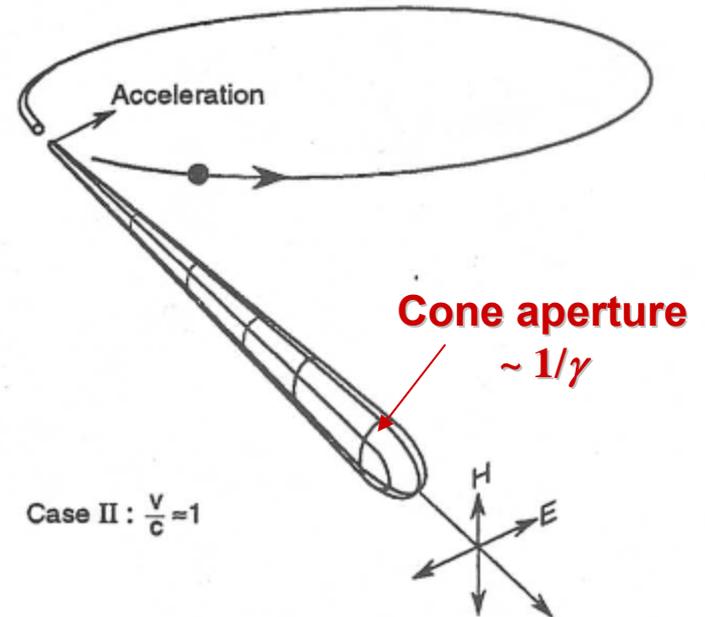

In a light source electrons follow curved trajectories in bend magnets and insertion devices. The transverse acceleration creates $e^- - \gamma$ separation generating **synchrotron radiation**.

SR Angular Distribution

Case I: $\frac{v}{c} \ll 1$

At low electron velocity (non-relativistic case) the radiation is emitted in a non-directional pattern

Case II: $\frac{v}{c} = 1$

When the electron velocity approaches the velocity of light, the emission pattern is folded sharply forward.

Radiation becomes more focused at higher energies.

SR Bandwidth

Due to extreme collimation of light

- observer sees only a small portion of electron trajectory (**a few mm**)

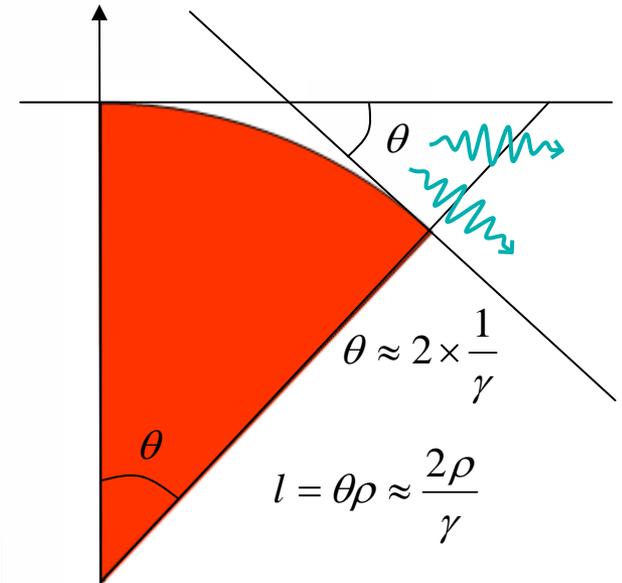

$$l \sim \frac{2\rho}{\gamma}$$

- Pulse length: difference in times it takes an electron and a photon to cover this distance

$$\Delta t \sim \frac{l}{\beta c} - \frac{l}{c} = \frac{l}{\beta c} (1 - \beta)$$

$$\Delta \omega = \frac{1}{\Delta t}$$

X-ray Ring Bend Magnet ($\epsilon_c=7.1$ keV):

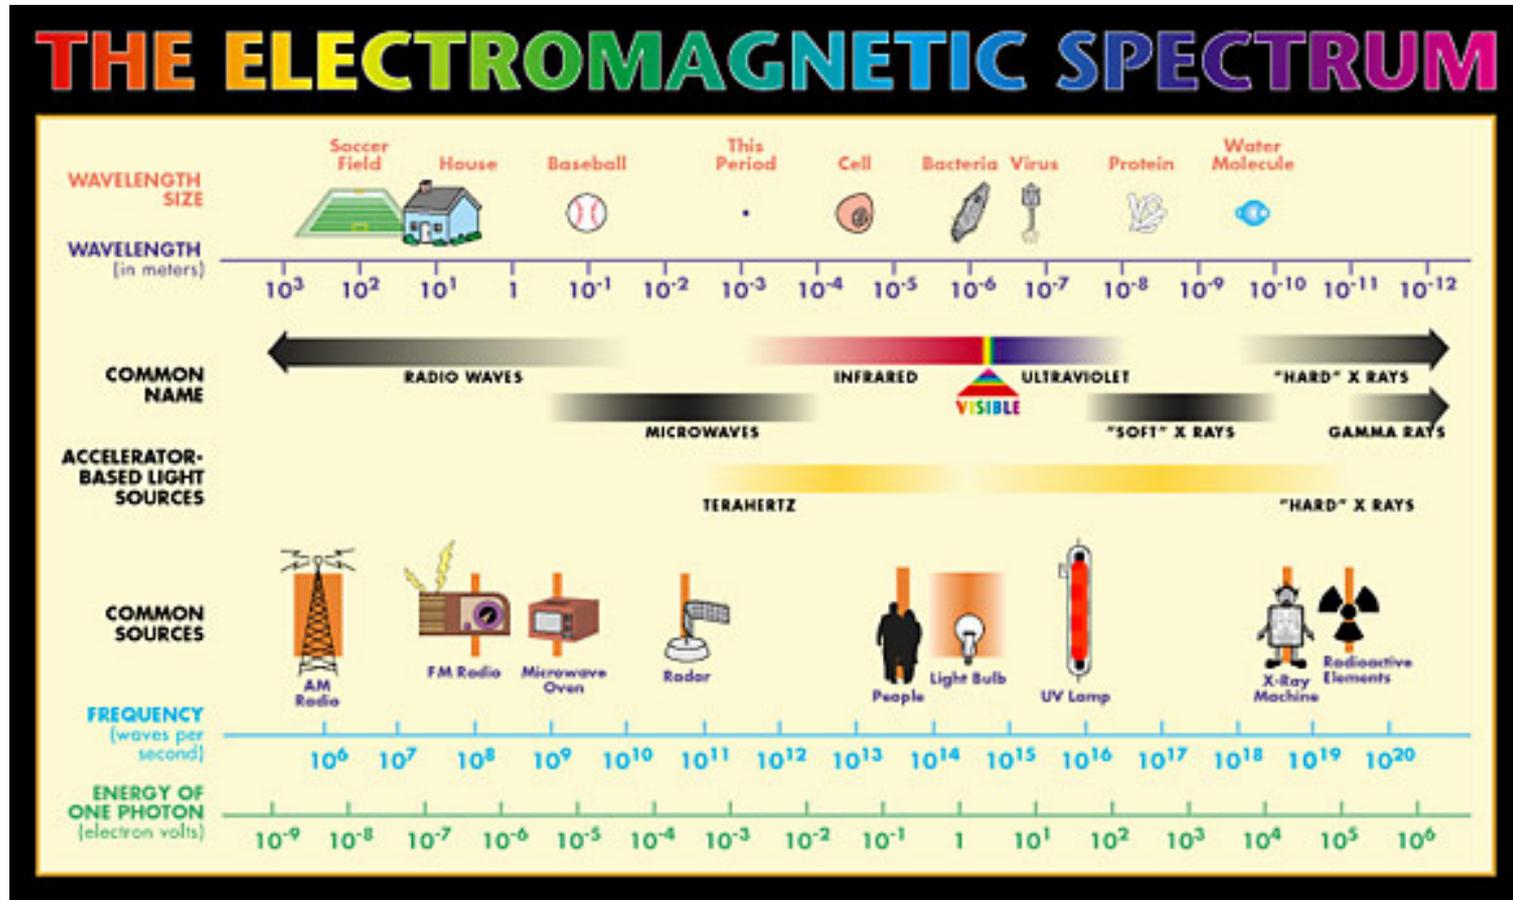

E=2.8 GeV ($\gamma=5479$, $1-\beta=1.7 \times 10^{-8}$), $\rho=6.875$ m:

$$l \cong 2.5 \text{ mm} \Rightarrow \Delta t \cong 1.4 \times 10^{-19} \text{ s} \Rightarrow \Delta \omega \cong 7.2 \times 10^{18} \text{ s}^{-1}$$

$$\omega \approx \Delta \omega \cong 7.2 \times 10^{18} \text{ s}^{-1} \Leftrightarrow \epsilon \approx \Delta \epsilon = \hbar \omega \cong 4.7 \text{ keV}$$

Very broad-band

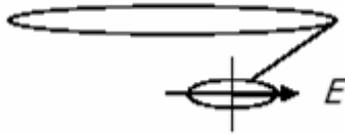

SR Spectrum

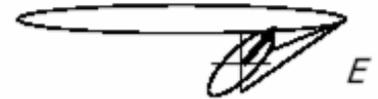

NSLS ranges from 0.12 meV (U12 IR) to 100 KeV (X17 SCW)

SR Polarization

Synchrotron radiation observed in the plane of the particle orbit is horizontally polarized, i.e. the electric field vector is horizontal

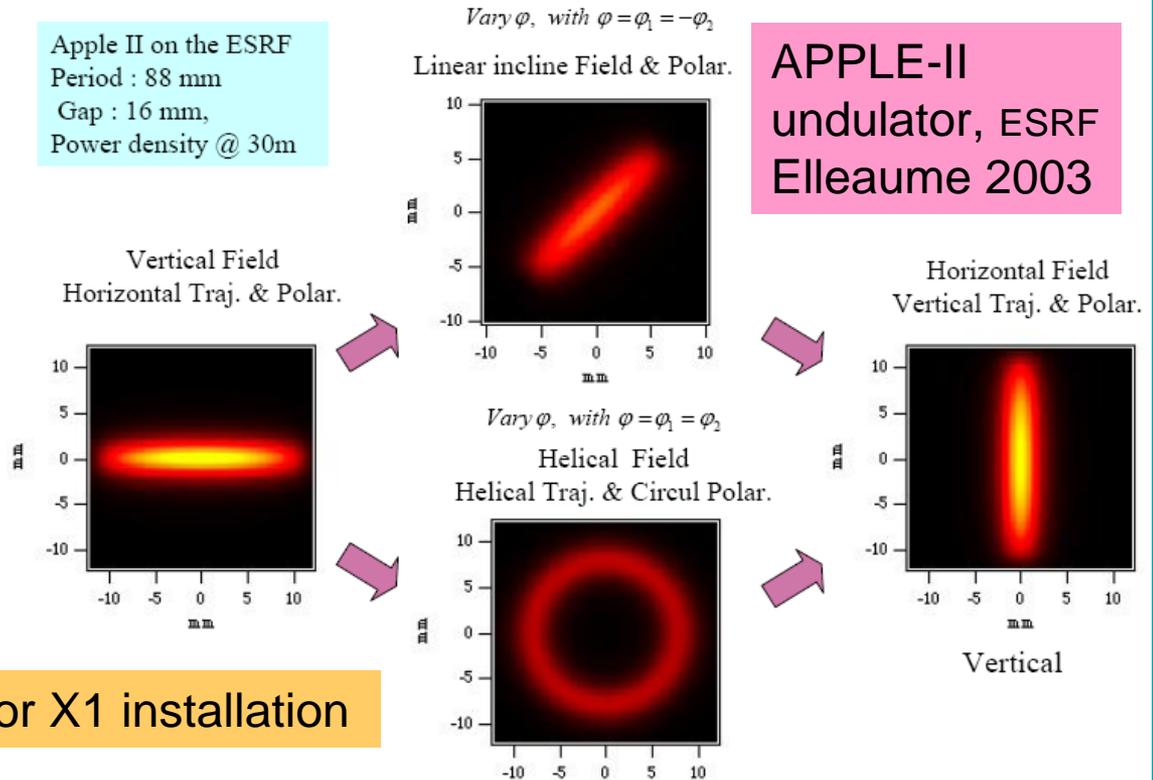

Observed out of the horizontal plane, the radiation is elliptically polarized

Specialized IDs apply “twists” to electron trajectory and make any desired (often variable) polarization

Apple II on the ESRF
 Period : 88 mm
 Gap : 16 mm,
 Power density @ 30m

APPLE-II undulator, ESRF
 Elleaume 2003

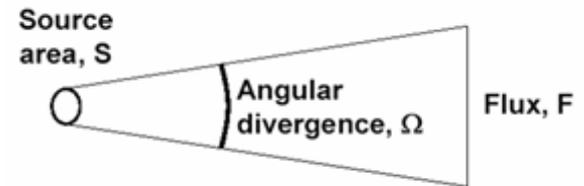

Apple-II is being considered for X1 installation

Brightness

- **brightness** is the key parameter of any particle source, incl. SR sources
- **brightness** is defined as 6-D phase space (x, p_x, y, p_y, t, E) density of particles
- **The same definition applies to the photon case;** taking into account that the Pauli exclusion principle does not apply to bosons => no limitation to achievable photon brightness exists from Quantum Mech.

$$\text{Brightness} = \frac{\text{\# of photons in given } \Delta\lambda/\lambda}{\text{sec, mrad } \theta, \text{ mrad } \varphi, \text{ mm}^2}$$

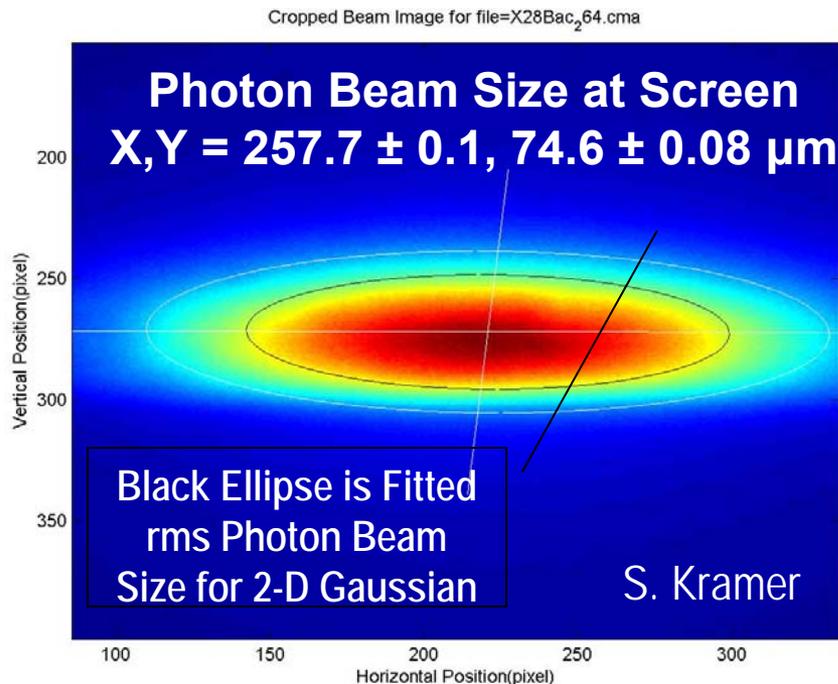

$$\text{Flux} = \frac{\text{\# of photons in given } \Delta\lambda/\lambda}{\text{sec}}$$

$$\text{Flux} = \frac{d\dot{N}}{d\lambda} = \int \text{Brightness } dS d\Omega$$

- For a given flux, **smaller emittance** (transverse phase space area) **sources** have **larger brightness**

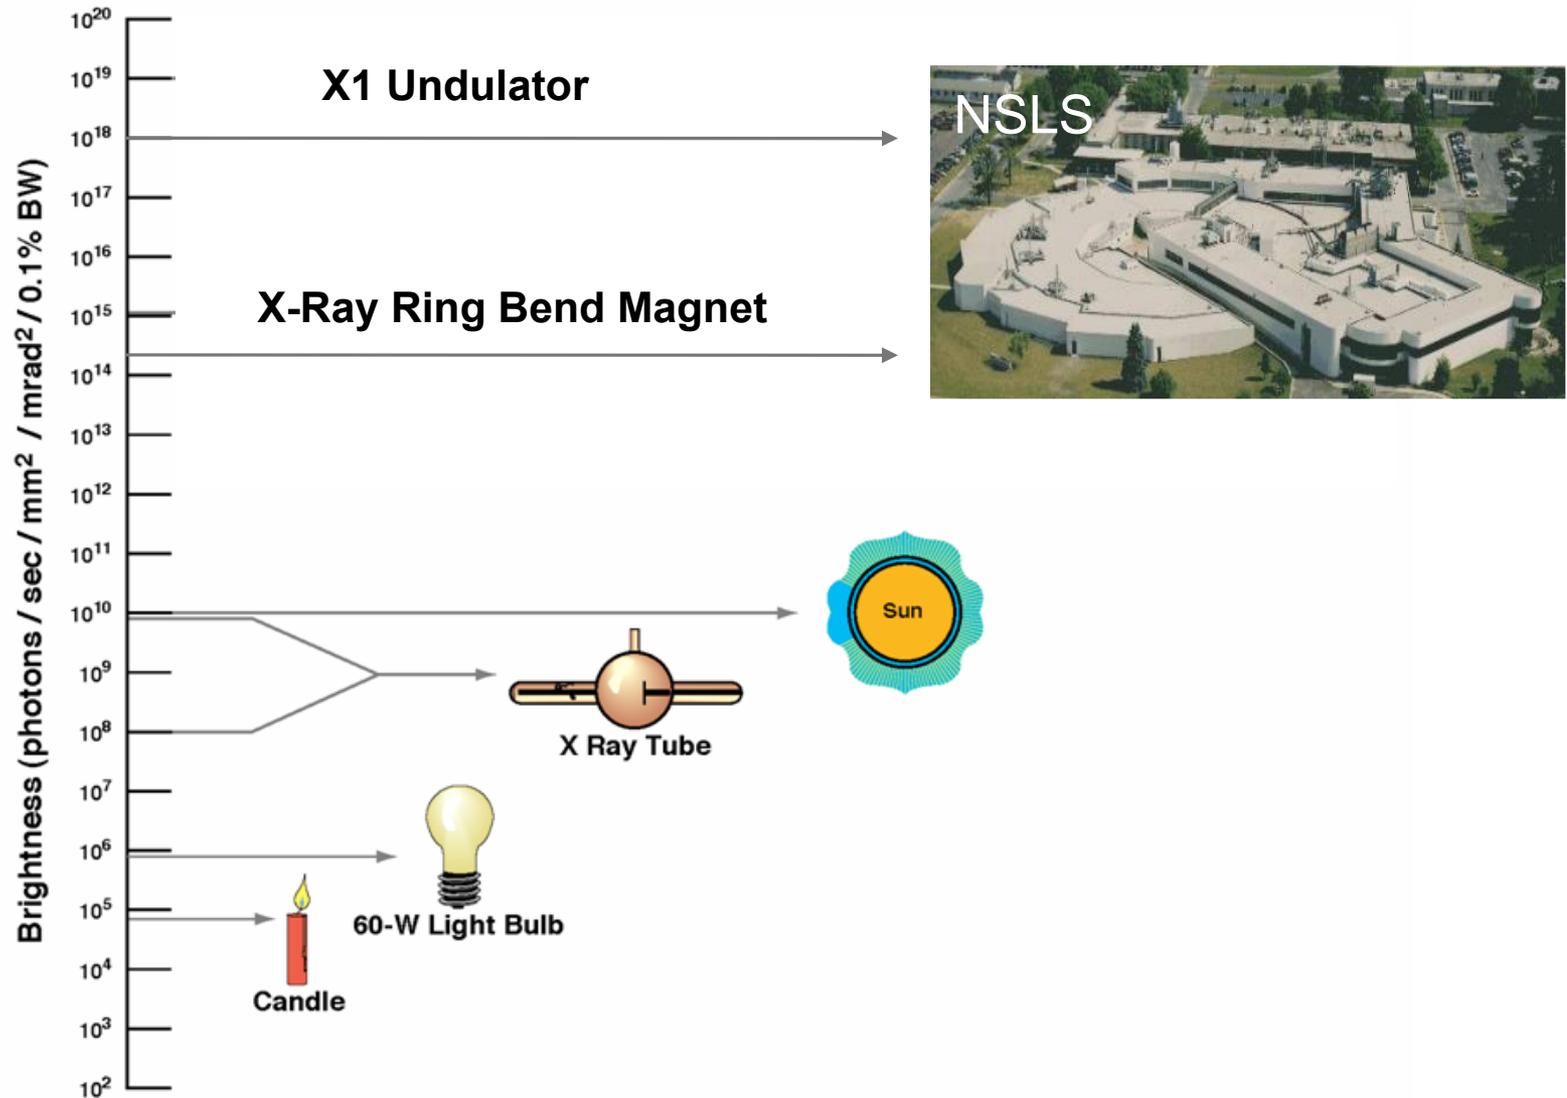

How Do We Know the Emittance?

X-28 Emittance Meter: X-Ray Pinhole Camera

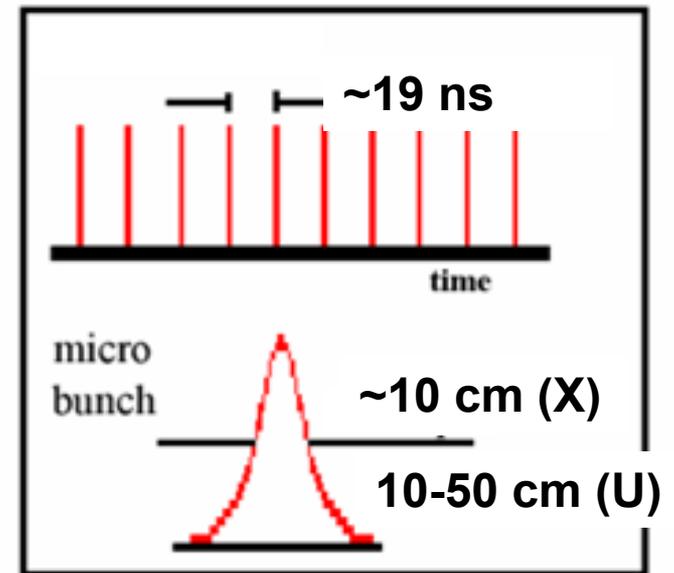

Emittance: $\varepsilon_{x,y} = 67.9 \pm 3$, 0.36 ± 0.05 nm
Coupling: $\chi \sim 0.53 \pm 0.08$ %

How Bright Are We?

Properties of SR that Make It Useful

Time structure @ NSLS

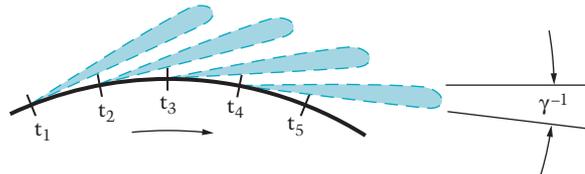

- High brightness and flux
- Very broad energy spectrum
- Highly polarized and short pulses

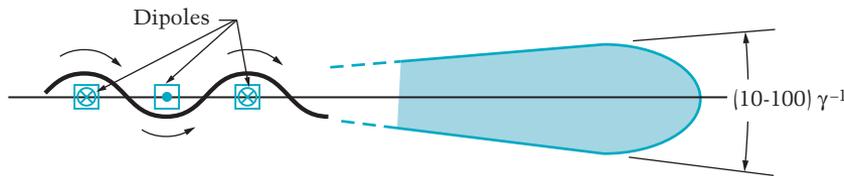

SR extends many useful properties of conventional lasers into x-ray regime!

- Partial coherence
- High stability

SR Sources in Storage Rings

bending magnet

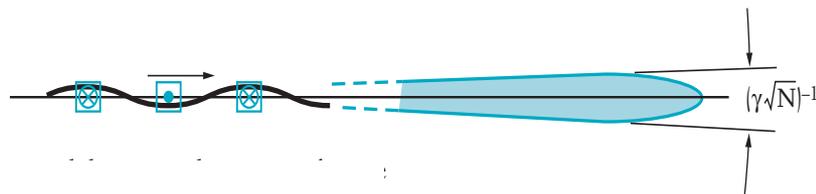

wiggler - incoherent superposition

Continuous spectrum characterized by **critical energy, ϵ_c**

$$\epsilon_c(\text{keV}) = 0.665 B(\text{T}) E^2(\text{GeV})$$

$$B = 1.4 \text{ T} \quad E = 0.8 \text{ GeV} \quad \epsilon_c = 0.6 \text{ keV}$$

$$B = 1.4 \text{ T} \quad E = 2.8 \text{ GeV} \quad \epsilon_c = 7 \text{ keV}$$

undulator - coherent interference

Quasi-monochromatic spectrum with peaks at

$$\lambda_1 = \frac{\lambda_u}{2\gamma^2} \left(1 + \frac{K^2}{2}\right) \sim \frac{\lambda_u}{\gamma^2} \text{ (fundamental)}$$

$$\epsilon_1(\text{keV}) = \frac{0.95 E^2(\text{GeV})}{\lambda_u(\text{cm}) \left(1 + \frac{K^2}{2}\right)}$$

$K \sim 1$ is undulator parameter

+ harmonics at higher energy

Building a Storage Ring Light Source 101

1) Take evacuated beam pipe

ADD:

2) Bends (dipoles) to form e-beam trajectory (& as SR sources)

3) Quadrupole magnets to focus e-beam transversely

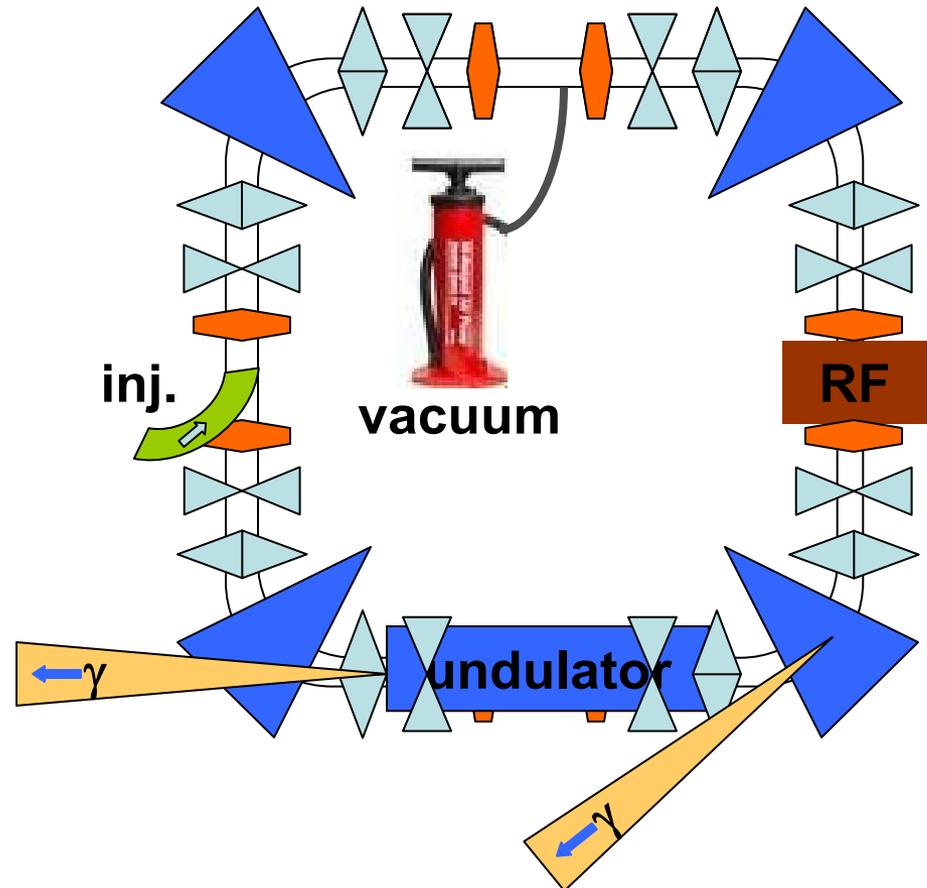

4) Sextupoles for achromatic focusing

5) RF to make up for energy loss; also provides longitudinal focusing (bunching)

6) Injection system

7) IDs into avail. straight sections

8) Beamlines to deliver photons to the Users

Essential Elements of a Light Source

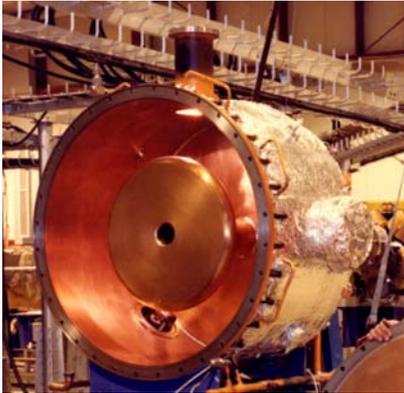

VUV Ring Construction
~1980

Sextupoles

Bend magnet

Quadrupoles

Beamline ports

53 MHz RF cavity

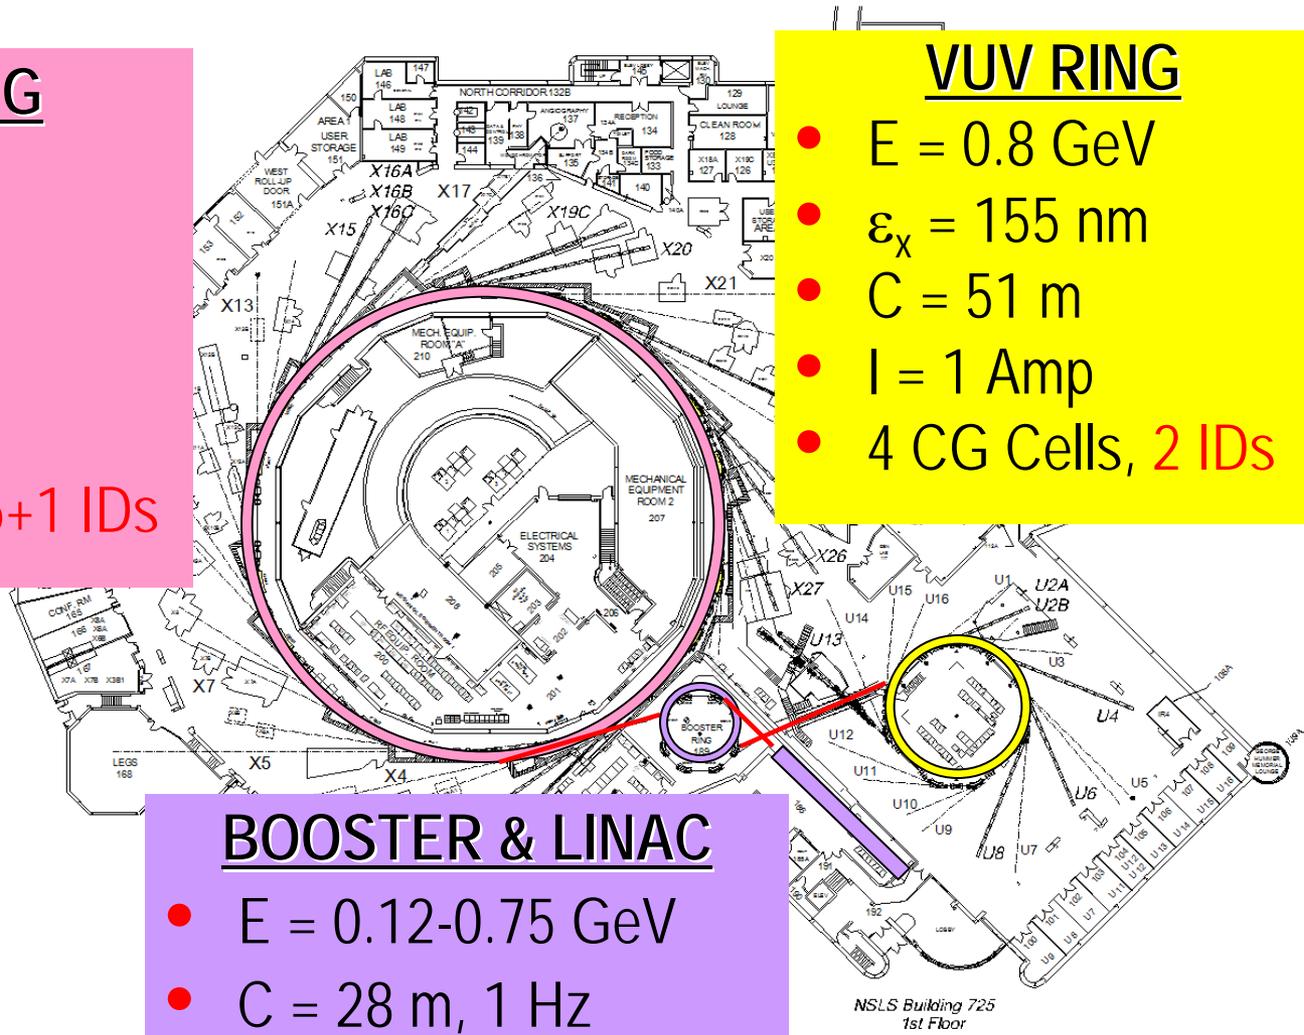

NSLS Accelerators Today

XRAY RING

- $E = 2.8 \text{ GeV}$
- $\epsilon_x = 65 \text{ nm}$
- $C = 170 \text{ m}$
- $I = 0.3 \text{ Amp}$
- 8 CG Cells, 6+1 IDs

VUV RING

- $E = 0.8 \text{ GeV}$
- $\epsilon_x = 155 \text{ nm}$
- $C = 51 \text{ m}$
- $I = 1 \text{ Amp}$
- 4 CG Cells, 2 IDs

BOOSTER & LINAC

- $E = 0.12\text{-}0.75 \text{ GeV}$
- $C = 28 \text{ m}, 1 \text{ Hz}$
- $I = 0.03 \text{ Amp}$

NSLS VUV Ring

Essential Parameters

- Critical energy: 622 eV ($\lambda_c = 19.9 \text{ \AA}$)
- Emittances: $\varepsilon_x \sim 160 \text{ nm}$, $\varepsilon_y \sim 4 \text{ nm}$
- Beam sizes
Bends: $(\sigma_x, \sigma_y) : 540\text{-}570 \text{ }\mu\text{m}, 170\text{-}200 \text{ }\mu\text{m}$
IDs: $(\sigma_x, \sigma_y) : 1240 \text{ }\mu\text{m}, 220 \text{ }\mu\text{m}$

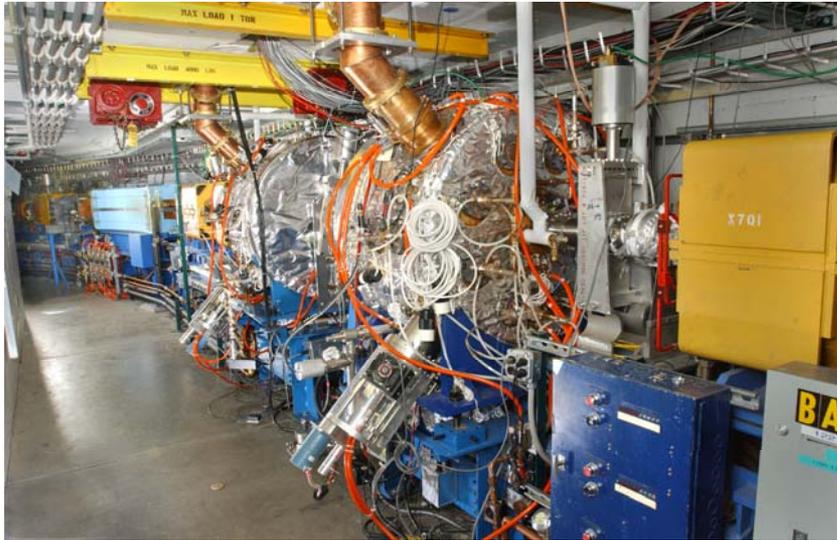

Operations

- Reliability exceeding 95% at 808 MeV
- High Current $\sim 1 \text{ Amp}$ in 7/9 bunches
- 4th Harmonic Cavity for beam lifetime
- Both Straights have IDs
- Longitudinal Coupled Bunch Feedback
- H&V Global Orbit Feedback
- 90 x 90 mrad IR ports

R&D

- Bursting CSR & Microwaves
- Laser Slicing & Coherent IR

NSLS X-Ray Ring

Essential Parameters

- Critical energy 7.1 keV ($\lambda_c = 1.75 \text{ \AA}$)
- Emittances: $\varepsilon_x \sim 60 \text{ nm}$, $\varepsilon_y \sim 0.3 \text{ nm}$
- Beam sizes
Bends: $(\sigma_x, \sigma_y) : 260\text{-}460 \text{ }\mu\text{m}, 60\text{-}90 \text{ }\mu\text{m}$
IDs: $(\sigma_x, \sigma_y) : 310 \text{ }\mu\text{m}, 11 \text{ }\mu\text{m}$

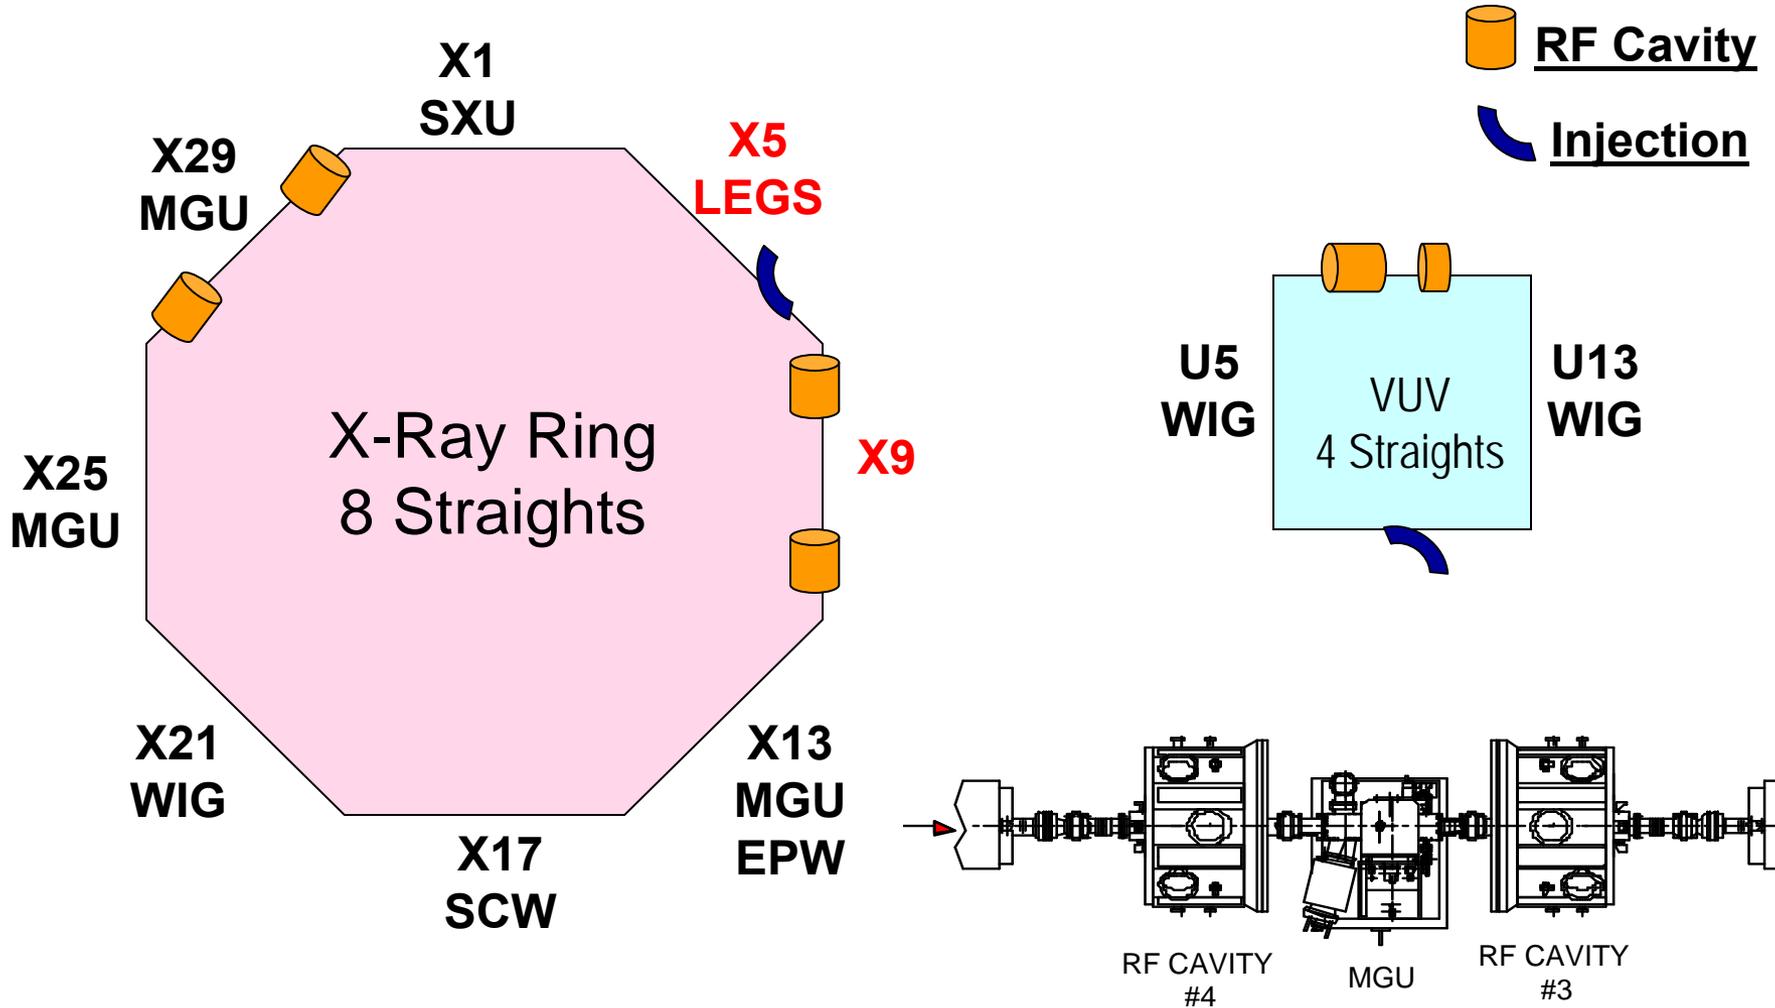

Operations

- Reliability of 90-95% at 2.8 GeV
- High Current $\sim 0.3 \text{ Amp}$ in 25/30 Bunches
- Inject @ 0.75 GeV and Ramp Up
- Four New RF Cavities Provide 1 MV
- Six of Eight Straight Sections have IDs
- H&V Global Orbit Feedback

R&D

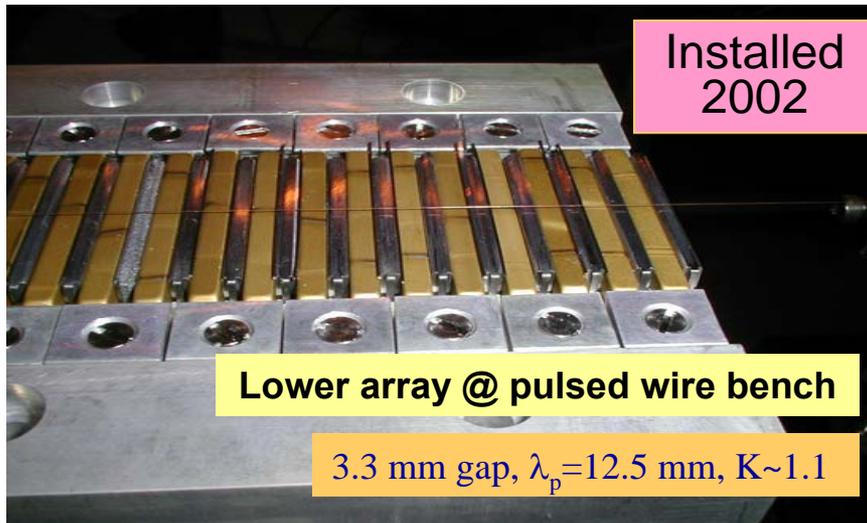

- Small Gap Insertion Devices
- Dynamic Aperture with EPU + IDs

NSLS Insertion Devices: Near Capacity

Mini-Gap In-Vacuum Undulators

NSLS X13 MGU

- MGUs are one of greatest successes at NSLS
- Provide hard X-ray photons on the cheap
- Paved the way for Intermediate Energy Light Sources
- Will be heavily used at NSLS-II

NSLS X25 MGU

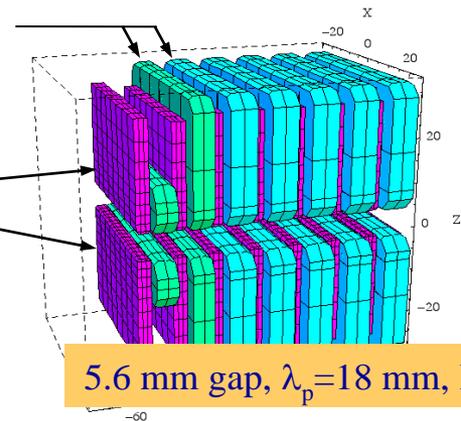

NdFeB Magnets:
new "hybrid car
motor" grade

Vanadium
Permendur
Poles

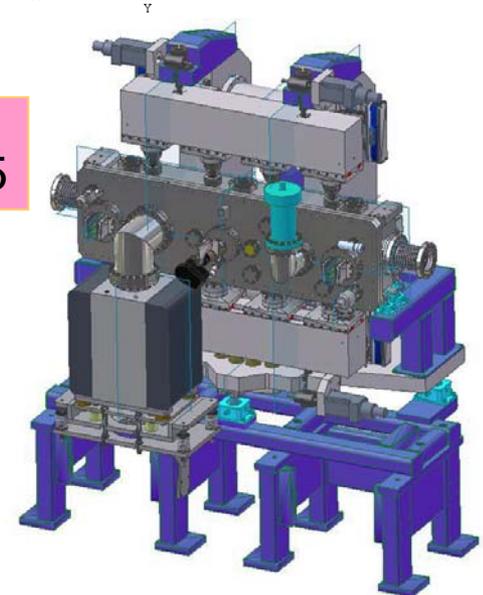

Design:

NSLS (magnetic)

ADC, Inc (mech.)

Installed
Dec. 2005

Conclusions and Outlook

NSLS Storage rings are highly optimized but still improving

- In Place: Mini-gap & variable polarization IDs, digital feedback, 4th harmonic cavity, EPICS-like controls ...
- To Be Done: New IDs, improved injection, stability & reliability, ...

NSLS-II Storage ring is the future of NSLS

- Will Provide: much higher brightness, many straight sections filled with advanced IDs, high beam stability, unprecedented energy resolution, etc
- Many Potential Synergies with Present NSLS

A wealth of Research Opportunities at NSLS & NSLS-II

- User Techniques & Applications: talks and the rest of this workshop
- Accelerator R&D: NSLS Rings & SDL provide a wealth of opportunities for advanced accelerator R&D
